Karel Knows 4 Commands

```
move

turnLeft

putBeeper

pickBeeper
```

Karel Knows 4 Commands

```
move

turnLeft

putBeeper

pickBeeper
```

"methods"

Defining New Commands

We can make new commands (or **methods**) for Karel. This lets us *decompose* our program into smaller pieces that are easier to understand.

```
private void name() {
      statement;
      statement;
      ...
}
```

For example:

```
private void turnRight() {
      turnLeft();
      turnLeft();
      turnLeft();
}
```

Control Flow: For Loops

```
for (int i = 0; i < max; i++) {
    statement;
    statement;
    ...
}
```

Repeats the statements in the body ***max*** times.

Control Flow: While Loops

```
while (condition) {
    statement;
    statement;
    ...
}
```

Repeats the statements in the body until ***condition*** is no longer true.

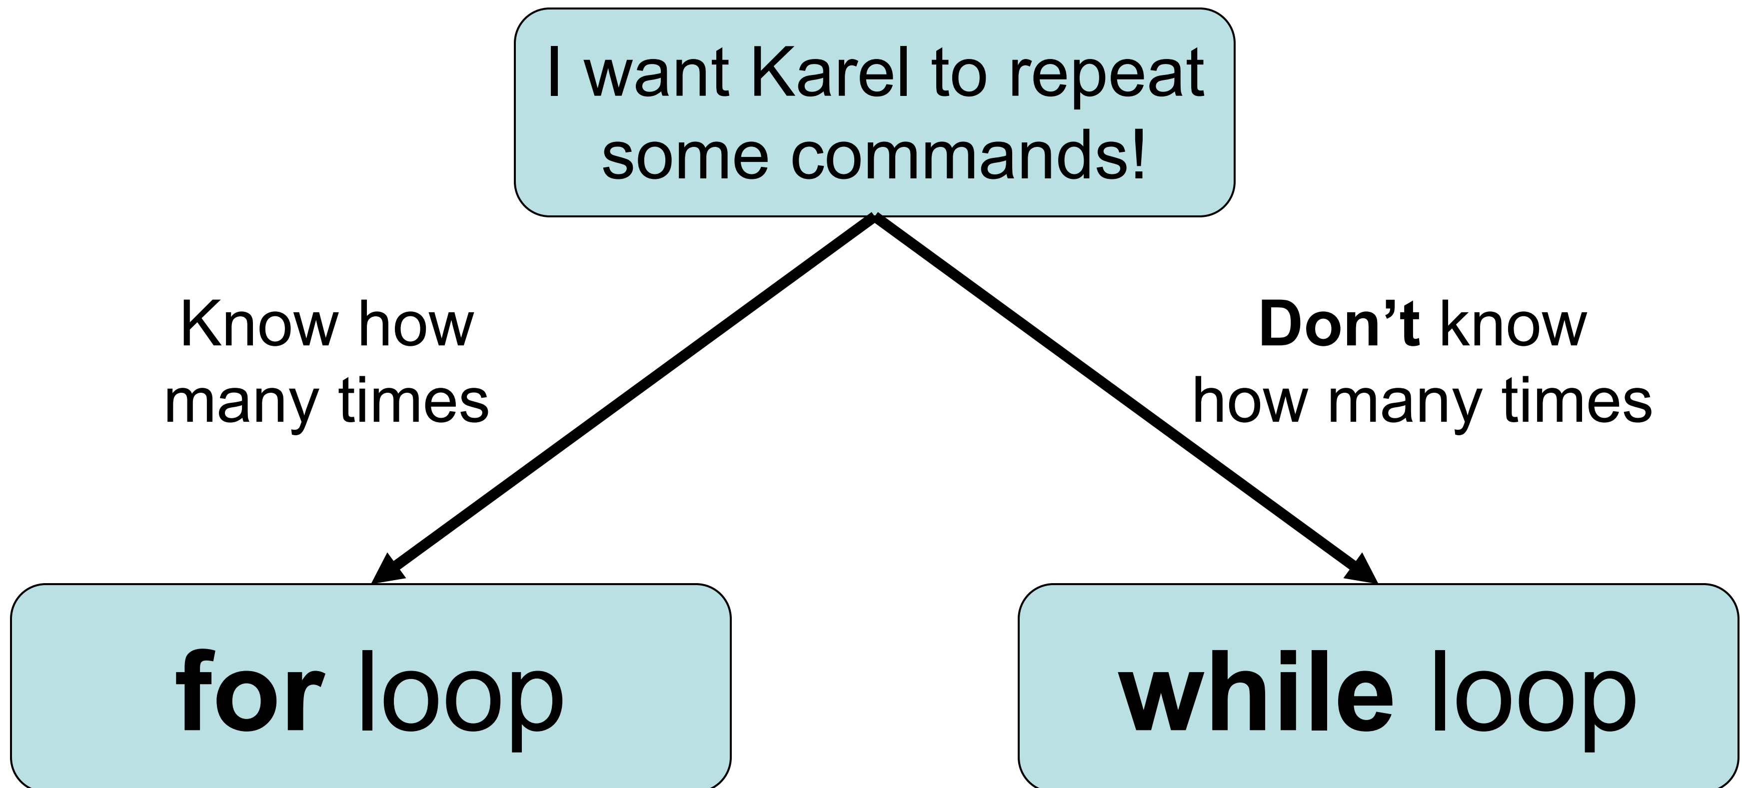
Each time, Karel executes *all statements*, and **then** checks the condition.

Possible Conditions

Test	*Opposite*	*What it checks*
`frontIsClear()`	**`frontIsBlocked()`**	Is there a wall in front of Karel?
`leftIsClear()`	**`leftIsBlocked()`**	Is there a wall to Karel's left?
`rightIsClear()`	**`rightIsBlocked()`**	Is there a wall to Karel's right?
`beepersPresent()`	**`noBeepersPresent()`**	Are there beepers on this corner?
`beepersInBag()`	**`noBeepersInBag()`**	Any there beepers in Karel's bag?
`facingNorth()`	**`notFacingNorth()`**	Is Karel facing north?
`facingEast()`	**`notFacingEast()`**	Is Karel facing east?
`facingSouth()`	**`notFacingSouth()`**	Is Karel facing south?
`facingWest()`	**`notFacingWest()`**	Is Karel facing west?

*This is **Table 1** on page 18 of the Karel coursereader.*

Loops Overview



Fencepost Structure

The fencepost structure is useful when you want to loop a set of statements, but do one part of that set 1 *additional* time.

```
putBeeper();                    // post
while (frontIsClear()) {
    move();                     // fence
    putBeeper();                // post
}

while (frontIsClear()) {
    putBeeper();                // post
    move();                     // fence
}
putBeeper();                    // post
```

If/Else Statements

```
if (condition) {
    statement;
    statement;
    ...
} else {
    statement;
    statement;
    ...
}
```

Runs the first group of statements if ***condition*** is true; otherwise, runs the second group of statements.

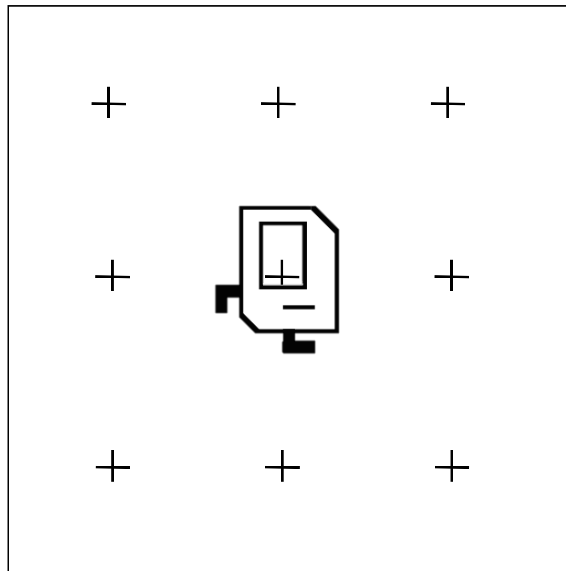
Infinite Loops

Infinite Loops

Rinse
Lather
Repeat

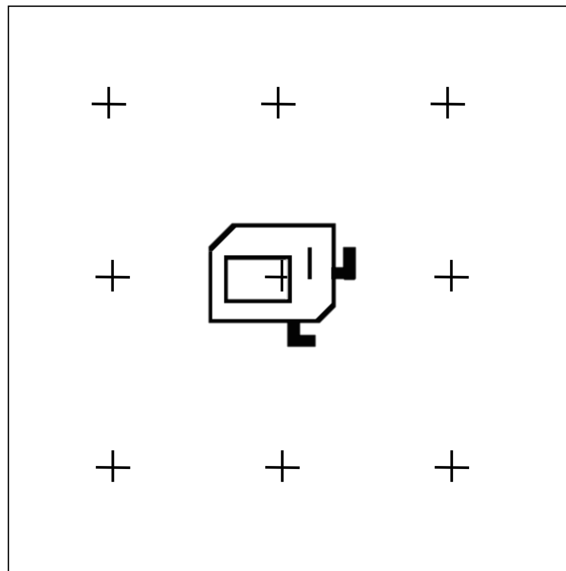
Infinite Loops

```
private void turnToWall() {
    while(leftIsClear()) {
        turnLeft();
    }
}
```



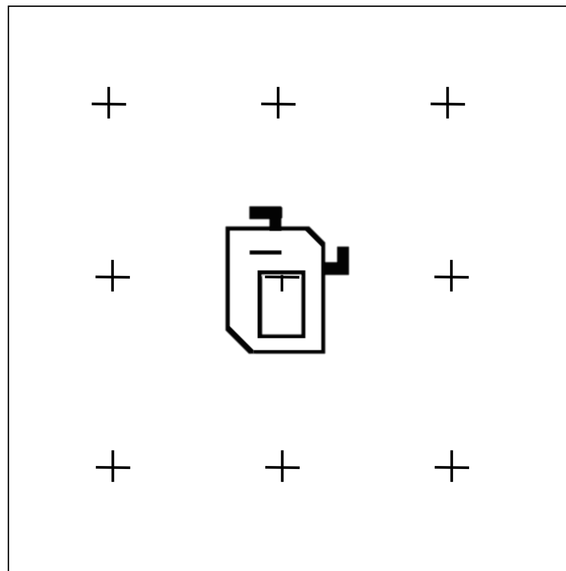
Infinite Loops

```
private void turnToWall() {
    while(leftIsClear()) {
        turnLeft();
    }
}
```



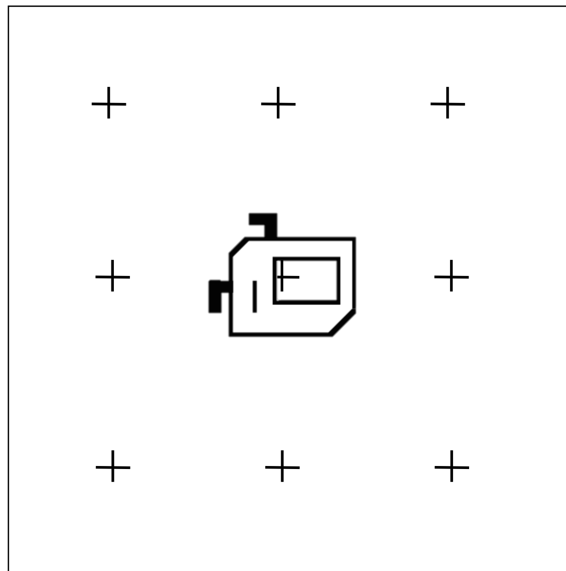
Infinite Loops

```
private void turnToWall() {
    while(leftIsClear()) {
        turnLeft();
    }
}
```



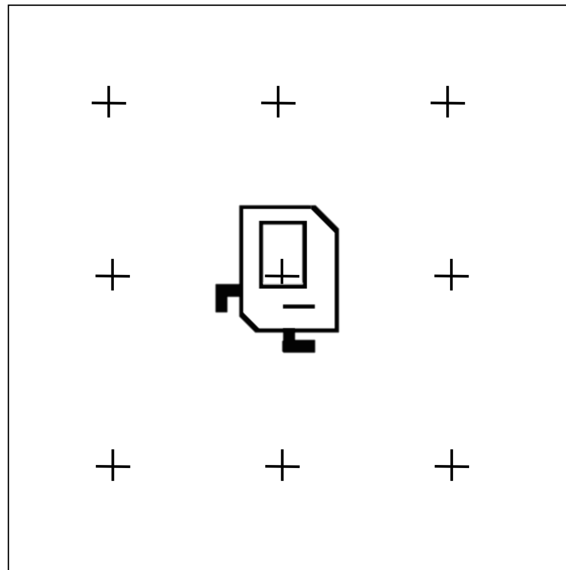
Infinite Loops

```
private void turnToWall() {
    while(leftIsClear()) {
        turnLeft();
    }
}
```



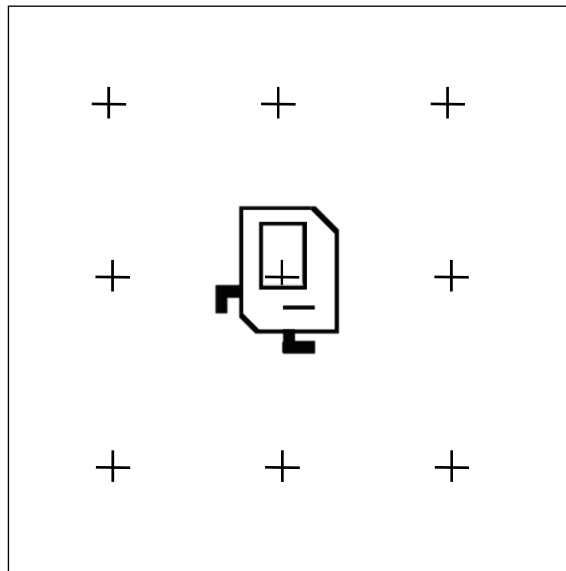
Infinite Loops

```
// Karel will keep turning left forever!
private void turnToWall() {
    while(leftIsClear()) {
        turnLeft();
    }
}
```



Infinite Loops

```
private void turnToWall() {
    while(leftIsClear()) {
        if (frontIsBlocked()) {
            turnLeft();
        }
    }
}
```



Infinite Loops

```
// Karel will be stuck in this loop forever!
private void turnToWall() {
    while(leftIsClear()) {
        if (frontIsBlocked()) {
            turnLeft();
        }
    }
}
```

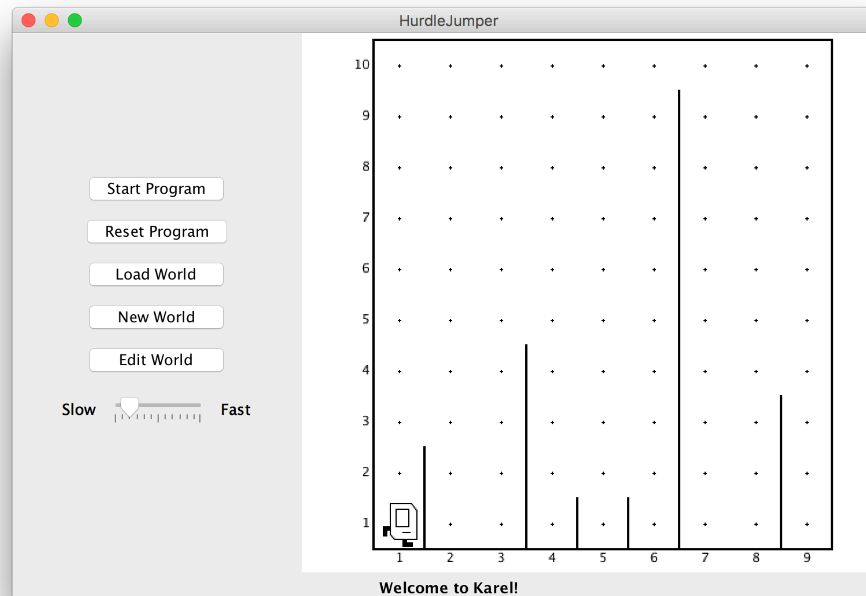
HurdleJumper

- We want to write a Karel program that hops hurdles.
  - Karel starts at (1,1) facing East, and should end up at the end of row 1 facing east.
  - The world has 9 columns.
  - There are an unknown number of ”hurdles” (walls) of varying heights that Karel must ascend and descend to get to the other side.



HurdleJumper

Demo

Pre/post comments

- **precondition**: Something you *assume* is true at the start of a method.
- **postcondition**: Something you *promise* is true at the end of a method.
  - pre/post conditions should be documented using comments.

```
/*
 * Jumps Karel over one hurdle of arbitrary height.
 * Pre:  Karel is facing east, next to a hurdle.
 * Post: Karel is facing east at the bottom of the other
 * side of the hurdle.
 */
public void jumpHurdle() {
    ascendHurdle();
    move();
    descendHurdle();
}
```

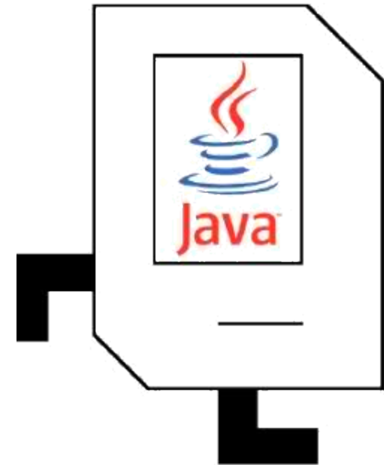
- Decomposition
- Practice: Roomba
- Debugging



Decomposition

- Breaking down problems into smaller, more approachable sub-problems (e.g. our own Karel commands)
- Each piece should solve **one** problem/task (< ~ 20 lines of code)
  - Descriptively-named
  - Well-commented!
- E.g. getting up in the morning:
  - Wake up
  - Brush teeth
    - Put toothpaste on toothbrush
    - Insert toothbrush into mouth
    - Move toothbrush against teeth
    - …
  - …

Top-Down Design

- Start from a large task and break it up into smaller pieces
- Ok to write your program in terms of commands that don't exist yet
- E.g. HurdleJumper

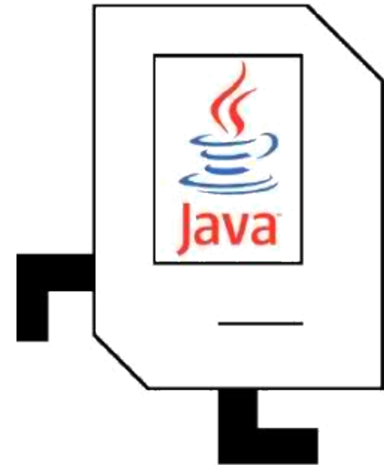
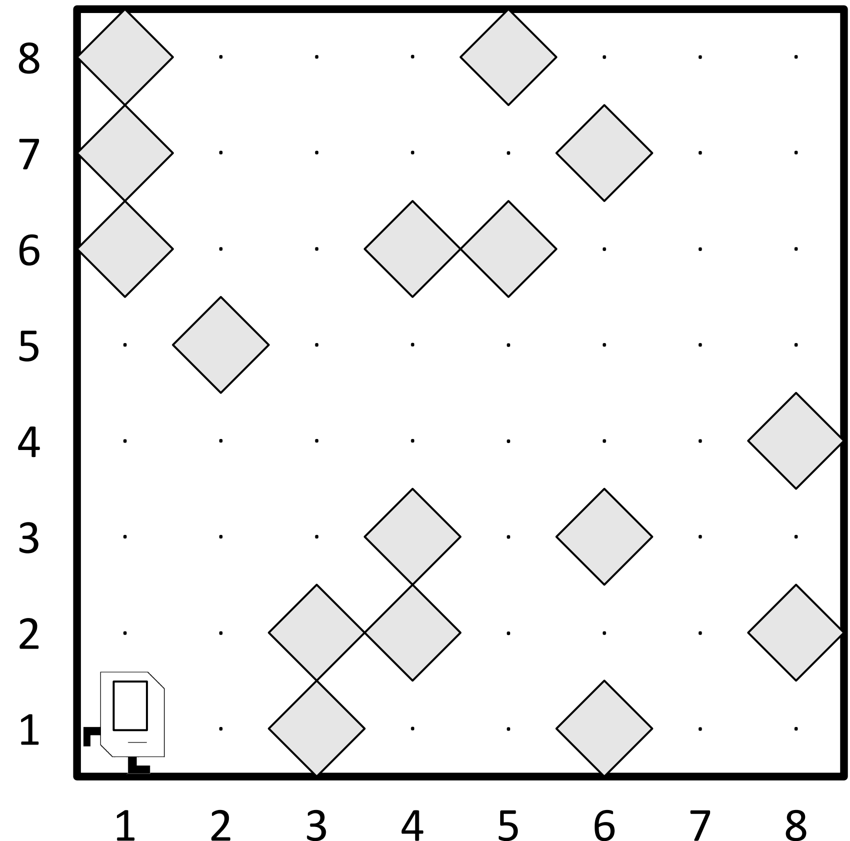
- Demo: HurdleJumper
- Decomposition
- Practice: Roomba
- Debugging



Practice: Roomba

- Write a **Roomba** Karel that sweeps the entire world of all beepers.
  - Karel starts at (1,1) facing East.
  - The world is rectangular, and some squares contain beepers.
  - There are no interior walls.
  - When the program is done, the world should contain 0 beepers.
  - Karel's ending location does not matter.



- How should we approach this tricky problem?

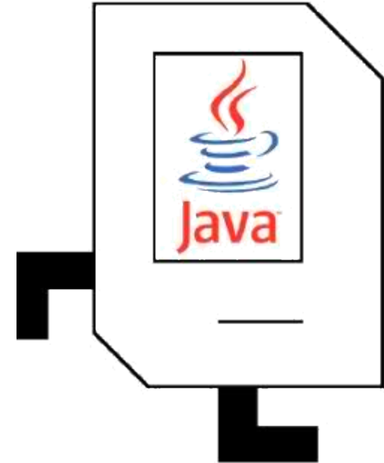
- Practice: Roomba
- Debugging



Debugging

- Finding and fixing unintended behavior in your programs.
- Try to narrow down *where* in your code you think the bug is occurring. (E.g. what command or set of commands)
- We can use Eclipse to help us figure out what our program is doing.
