## CS 106X

 Lecture 18: TreesWednesday, February 22, 2017

## Programming Abstractions (Accelerated)

 Winter 2017Stanford University
Computer Science Department
Lecturer: Chris Gregg

Programming Abstractions in C++, Section 16.1

## Today's Topics

-Logistics

- Midterm Tomorrow!
- Midterm will cover up to and including Linked Lists
- Introduction to Trees

## Trees

We have already seen trees in the class in the form of decision trees!

## Trees

## You've coded trees for recursive assignments!

Random expansion from sentence.txt grammar for symbol "<s>"

## Trees Can Describe Hierarchies

## Trees Can Describe Websites (HTML)

## Trees Can Describe Programs

```
// Example student solution
function run() {
    // move then loop
    move();
    // the condition is fixed
    while (notFinished()) {
        if (isPathClear()) {
            move();
        } else {
            turnLeft();
        }
        // redundant
        move();
    }
}
```

* This is a figure in an academic paper written by a recent CS106 student!

## Trees are inherently recursive

## What is a Tree (in Computer Science)?

- A tree is a collection of nodes, which can be empty. If it is not empty, there is a "root" node, $\boldsymbol{r}$, and zero or more non-empty subtrees, $\boldsymbol{T}_{\mathbf{1}}, \boldsymbol{T}_{\mathbf{2}}, \ldots, \boldsymbol{T}_{\boldsymbol{k}}$, whose roots are connected by a directed edge from $\boldsymbol{r}$.

## Tree Terminology

## What is a Tree (in Computer Science)?

- A tree is a collection of nodes, which can be empty. If it is not empty, there is a "root" node, $\boldsymbol{r}$, and zero or more non-empty subtrees, $\boldsymbol{T}_{\mathbf{1}}, \boldsymbol{T}_{\mathbf{2}}, \ldots, \boldsymbol{T}_{\boldsymbol{k}}$, whose roots are connected by a directed edge from $\boldsymbol{r}$.

- A tree is a collection of nodes, which can be empty. If it is not empty, there is a "root" node, $\boldsymbol{r}$, and zero or more non-empty subtrees, $\boldsymbol{T}_{\mathbf{1}}, \boldsymbol{T}_{\mathbf{2}}, \ldots, \boldsymbol{T}_{\boldsymbol{k}}$, whose roots are connected by a directed edge from $\boldsymbol{r}$.

## Tree Terminology

## What is a Tree (in Computer Science)?

- A tree is a collection of nodes, which can be empty. If it is not empty, there is a "root" node, $\boldsymbol{r}$, and zero or more non-empty subtrees, $\boldsymbol{T}_{\mathbf{1}}, \boldsymbol{T}_{\mathbf{2}}, \ldots, \boldsymbol{T}_{\boldsymbol{k}}$, whose roots are connected by a directed edge from $\boldsymbol{r}$.

## Tree Terminology

We can define a path from a parent to its children.

The path A-E-J-O has a length of three (the number of edges)

## Tree Terminology

The depth of a node is the length from the root. The depth of node J is 2 . The depth of the root is 0 .

The height of a node is the longest path from the node to a leaf. The height of node $F$ is 1 . The height of all leaves is 0 .

## Tree Terminology

The height of a tree is the height of the root (in this case, the height of the tree is 3 .

## Tree Terminology

Trees can have only one parent, and cannot have cycles

## Tree Terminology

Trees can have only one parent, and cannot have cycles

## Tree Terminology

Trees can have only one parent, and cannot have cycles

## 1

Node A has two parents

Node A has two parents

## Tree Terminology

Trees can have only one parent, and cannot have cycles

## Tree Terminology

Trees can have only one parent, and cannot have cycles

not a tree: the red edges make a cycle

## How can we build trees programmatically?

## How can we build trees programmatically?

Binary Tree:

## How can we build trees programmatically?

Binary Tree:

Linked List

## How can we build trees programmatically?

Binary Tree:

Linked List

## How can we build trees programmatically?

Linked List

## How can we build trees programmatically?

Binary Tree:

Linked List

## The Most Important Slide

Binary Tree:

```
struct Tree {
    string value;
    Tree *left;
    Tree *right;
};
```

## We Can Have Ternary Trees (or any number, $n$ )

## Ternary Tree:

```
struct Tree {
    string value;
Tree *left;
Tree *middle;
Tree *right;
```

\};

## We Can Have Ternary Trees (or any number, $n$ )

N -ary Tree:
struct Tree \{ string value;
Vector<Tree *> children;
\};

## Trees can be defined as either structs or classes

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

class Tree \{
private:
string value;
Vector<Tree *> children;
\};

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:
1.Pre-order

2.In-order
3.Post-order
4.Level-order

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:

## 1.Pre-order

2.In-order
3.Post-order
4.Level-order
1.Do something
2. Go left
3. Go right

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:
1.Pre-order
2. In-order
3.Post-order
4.Level-order

1. Go left
2.Do something
3.Go right

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:
1.Pre-order
2.In-order
3.Post-order
4.Level-order

1.Go left<br>2. Go right<br>3.Do something

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:
1.Pre-order

Hmm...can we do this recursively? We want to print the levels: 0, 1, 2 from left-to-right order

## Let's write some code to "traverse" the tree

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
```

There are multiple ways to traverse the nodes in a binary tree:
1.Pre-order

2.In-order 3.Post-order 4.Level-order

## Let's write some code

```
struct Tree {
    string value;
    Tree * left;
    Tree * right;
};
void preOrder(Tree * tree) {
    if(tree == NULL) return;
    cout<< tree->value <<" ";
    preOrder(tree->left);
    preOrder(tree->right) ;
}
void inOrder(Tree * tree) {
    if(tree == NULL) return;
    inOrder(tree->left);
    cout<< tree->value <<" ";
    inOrder(tree->right);
}
void postOrder(Tree * tree) {
    if(tree == NULL) return;
    postOrder(tree->left);
    postOrder(tree->right);
    cout<< tree->value << " ";
}
```

void levelOrder (Tree *tree) \{
Queue<Tree *>treeQueue;
treeQueue.enqueue (tree);
while (!treeQueue.isEmpty()) \{
Tree *node $=$ treeQueue. dequeue ();
cout << node->value << " ";
if (node->left != NULL) \{
treeQueue.enqueue (node->left);
\}
if (node->right ! = NULL) \{
treeQueue.enqueue (node->right);
\}
\}
\}
