

# Lecture 5

## Common neural networks for different clinical applications

Serena Yeung  
BIODS 388

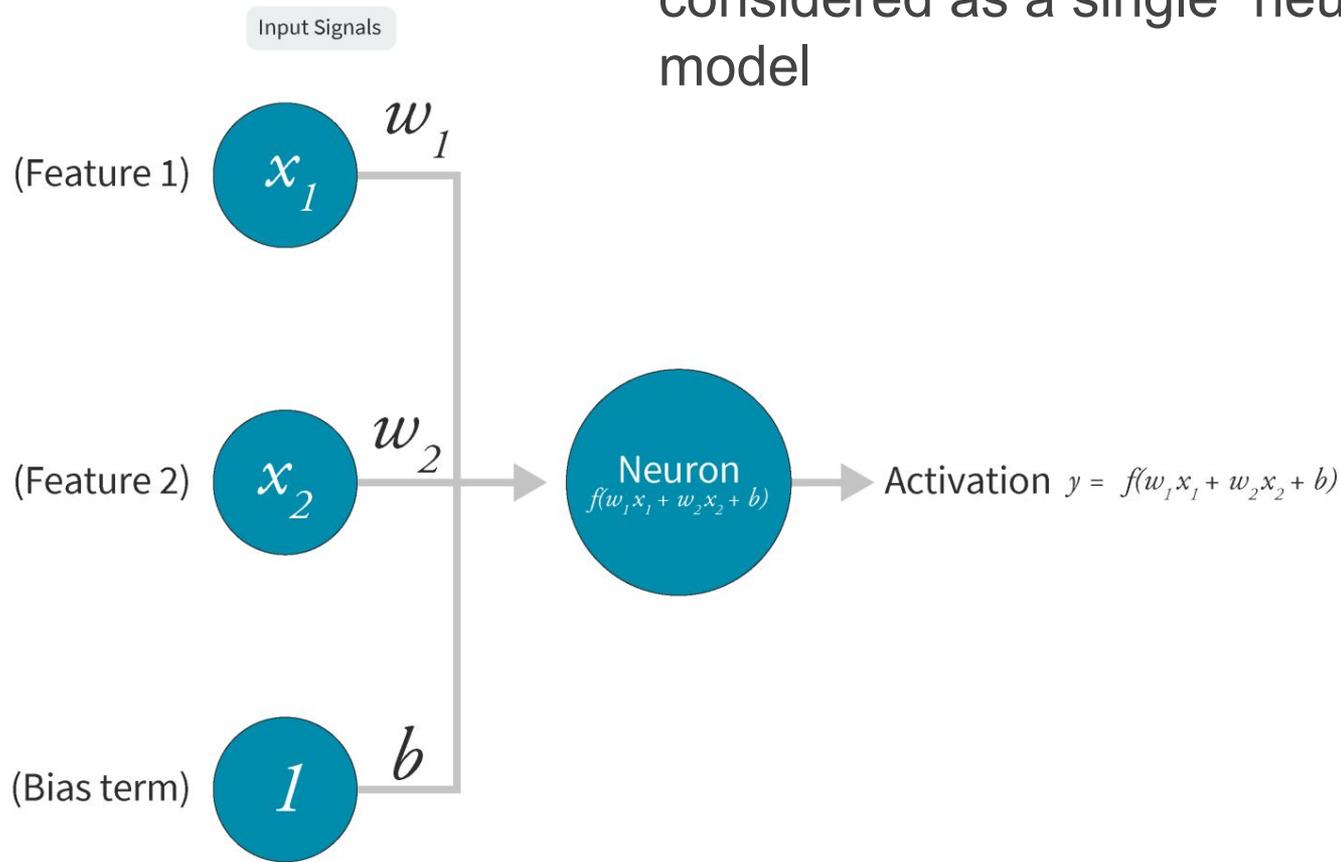

# Last time...

**Deep learning:** Machine learning models based on “deep” neural networks comprising millions (sometimes billions) of parameters organized into hierarchical layers.

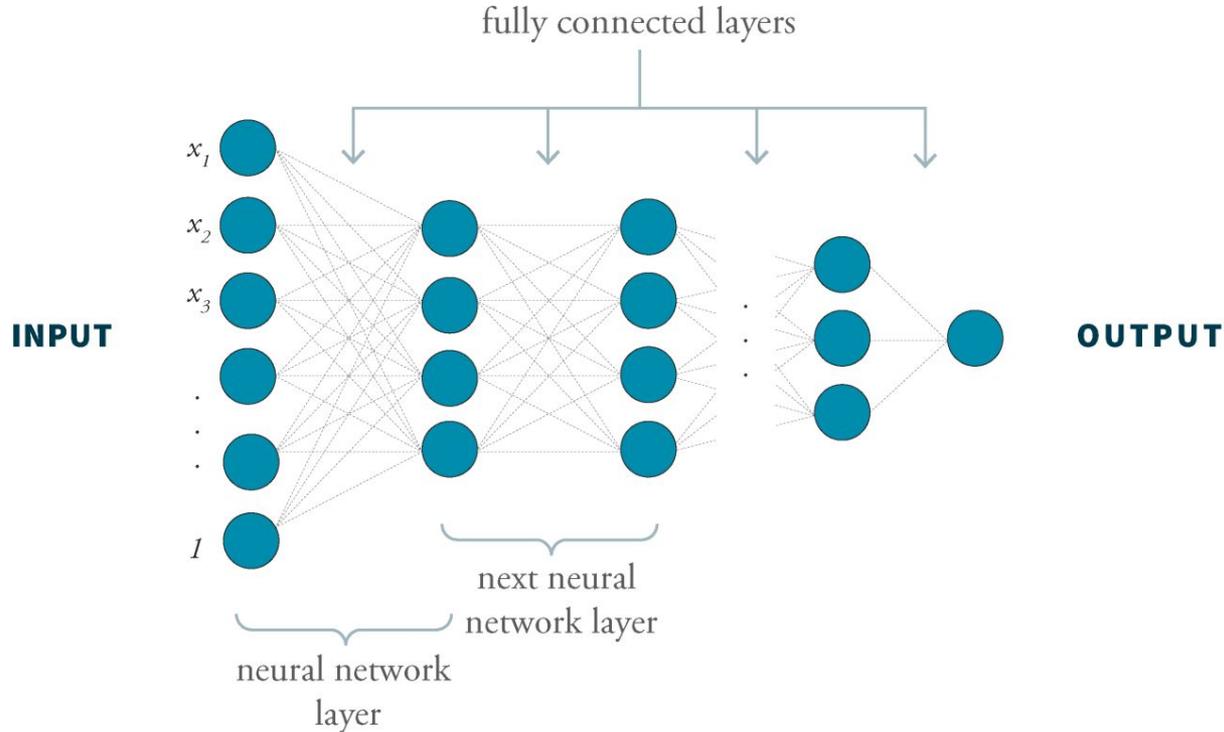

Features are multiplied and added together repeatedly, with the outputs from one layer of parameters being fed into the next layer -- before a prediction is made.

# Last time...

The logistic regression with sigmoid that we just saw can be considered as a single “neuron” model

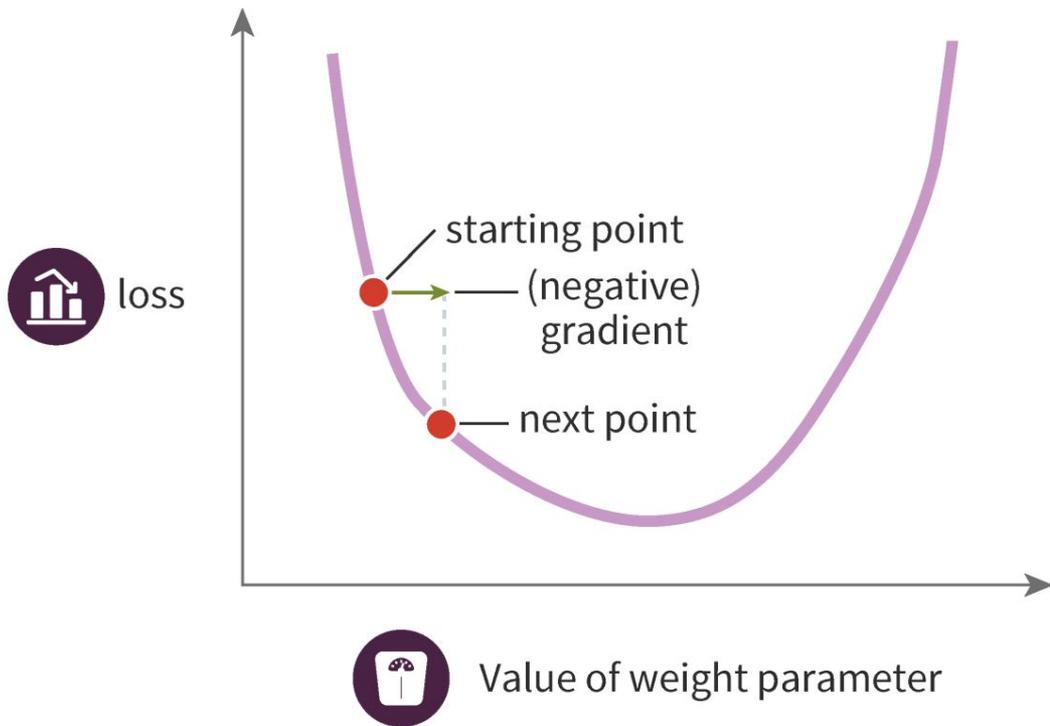

# Last time...

Fully connected layer: all neurons in the layer takes as input the full input to the layer (also called dense layer or linear layer)

# Last time...

## A GRAPHICAL LOOK AT GRADIENT DESCENT: *1D case (single weight parameter)*

# Last time...

# Last time...

**ANOTHER VISUALIZATION OF A CONVOLUTIONAL FILTER**

# Last time...

## CONVOLUTIONAL NEURAL NETWORKS (CNNs)

### Major advantages:

- Parameter efficient (filters “scan” the entire image for objects)
- Preserves spatial information (activations are the result of regional information)

# Today's Agenda

- More on a different class of unstructured data: text
- More on neural network variants for different types of AI tasks

## UNSTRUCTURED DATA

Physician Note

# Word Embeddings

Numerical representation of vocabulary of words, where “similar” words have similar representations

$$\begin{matrix} [0 & 0 & 1 & 0 & 0 & 0 & 0 & \dots & 0] & \times \\ \text{1xN word input (one-hot} & & & & & & & & & \\ \text{selection of word from a} & & & & & & & & & \\ \text{length-N vocabulary)} & & & & & & & & & \end{matrix} \begin{matrix} \begin{matrix} \begin{matrix} 0.5 & 0.2 & 0.1 \\ 0.6 & 0.1 & 0.6 \\ 0.5 & 0.8 & 0.2 \\ 0.7 & 0.9 & 0.3 \\ 0.3 & 0.5 & 0.1 \\ \dots \\ 0.7 & 0.8 & 0.1 \end{matrix} \\ \text{N x D embedding matrix} \end{matrix} = [0.5 & 0.8 & 0.2] \\ \text{D-dim word embedding} \end{matrix}$$

## Aside: how do we learn good word embeddings?

With a deep learning approach! Can design a loss function for a neural network, that captures the desiderata that similar words should occur in similar surrounding context. So, the numerical word embedding for a particular word should be able to be used to give a reasonable prediction of the identity of neighboring words.

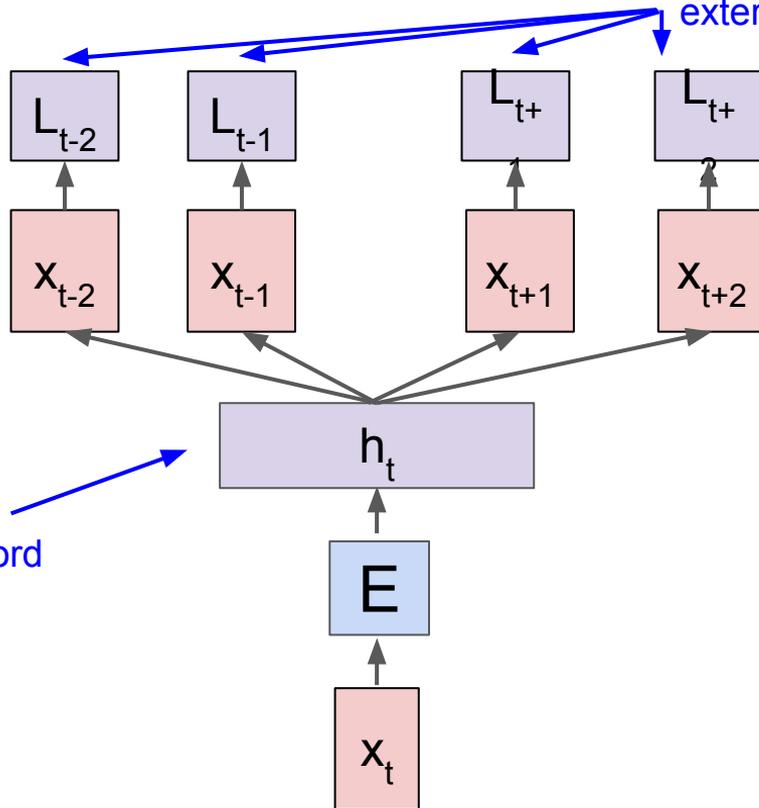

# Skip-gram model

Can train using a classification loss (e.g. cross-entropy loss we've already seen, extended to more than 2 classes) based only on the text structure, without any external labels!

Use word embedding vector to predict the word identity of a set of neighboring positions

(Each is an N-way classification if the dictionary has N words)

Word embedding (feature vector), of word at the t-th position

# Word embeddings

health	→	(170, 205, 102, 7, 174, 104, 176, 185, 192, 31, 211, 74, 42, 52, 16, 84, 80, 120, 101,

# CAN WE REPRESENT SEQUENCES OF WORDS (WORD EMBEDDINGS) AS INPUT TO FULLY-CONNECTED NEURAL NETWORKS?

**First attempt:** Connect the embeddings!

## Problems:

- Requires a HUGE number of parameters
- Highly sensitive to word displacement
- Destroys temporal information
- Cannot handle variable-sized input

# TRANSFORMER ARCHITECTURES: NEURAL NETWORKS WITH STACKS OF SELF-ATTENTION LAYERS

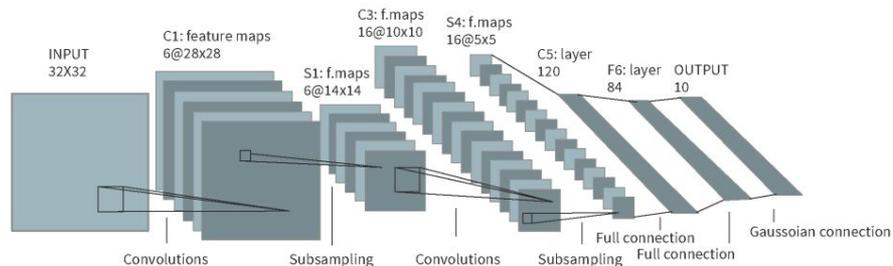

# MAJOR CLASSES OF NEURAL NETWORK ARCHITECTURES

## Fully connected neural networks

(fully connected layers, good for structured data inputs)

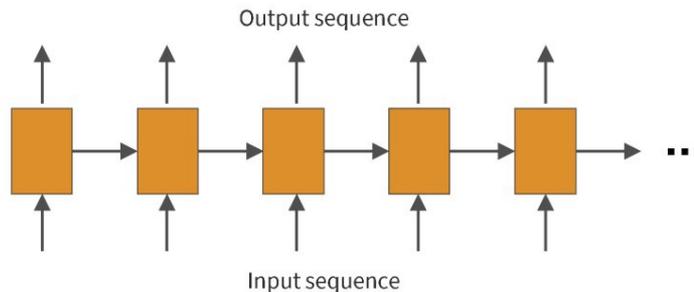

## Convolutional neural networks

(convolutional layers, good for image inputs)

## Recurrent neural networks

(fully connected layers modeling recurrence relation across sequence, good for sequence inputs)

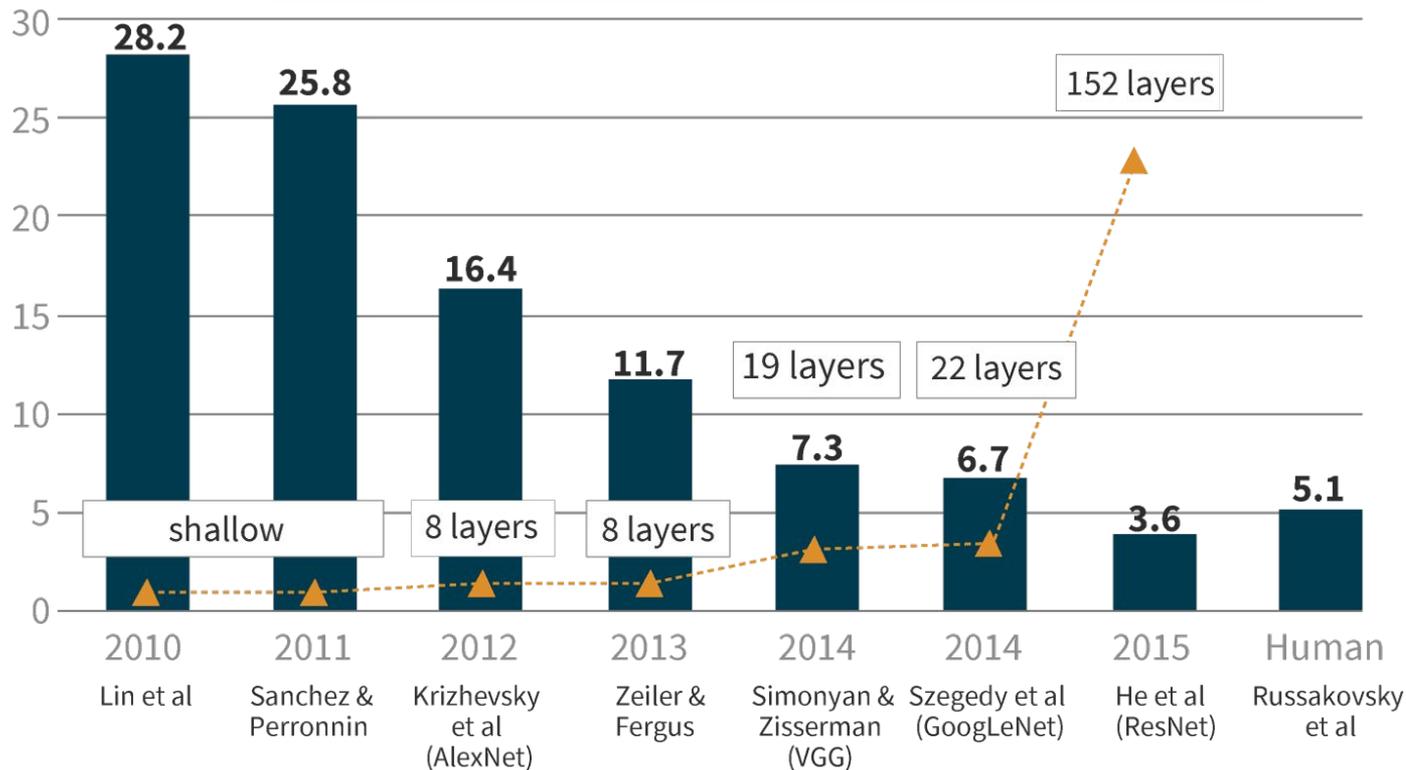

Let's revisit some more neural network architectures for  
different AI outputs

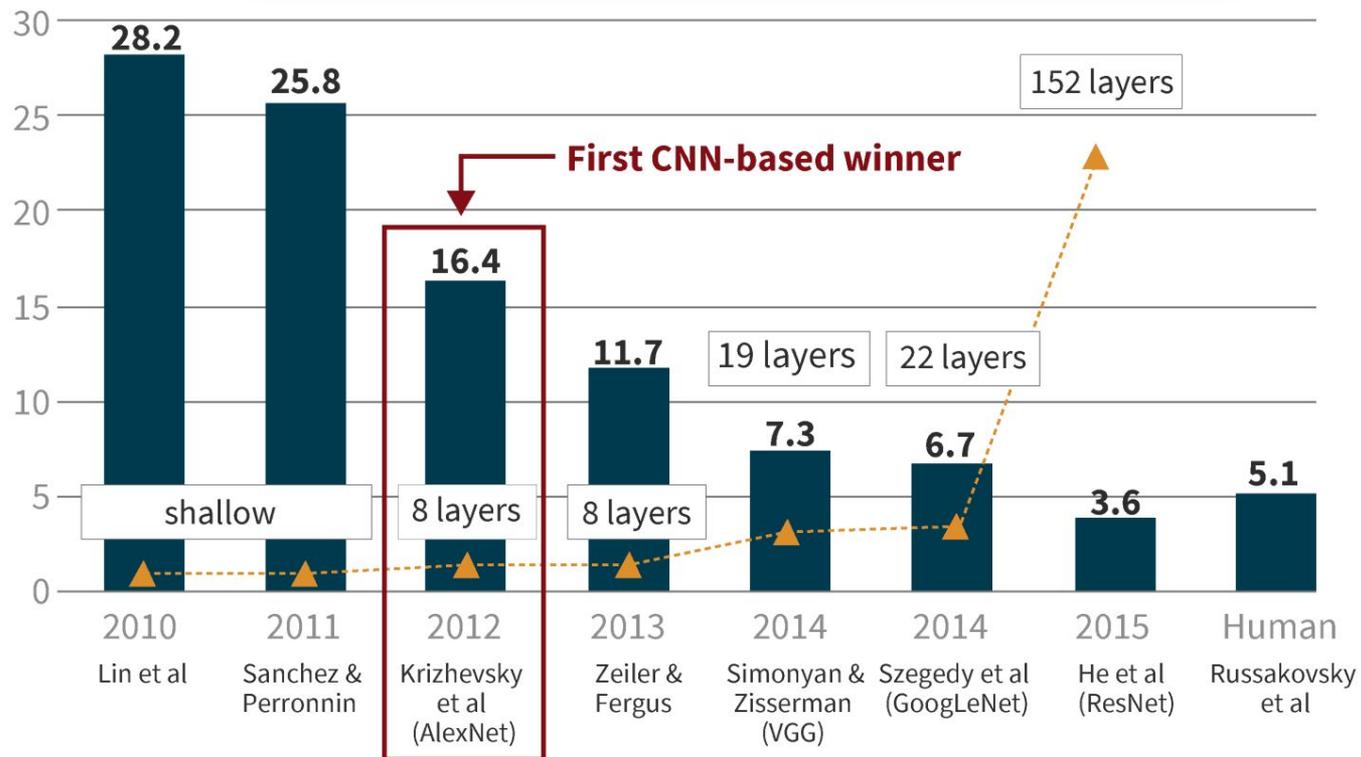

Let's revisit some more neural network architectures for  
different AI outputs

First, some commonly used architectures for  
**classification**

## IMAGENET LARGE SCALE VISUAL RECOGNITION CHALLENGE (ILSVRC) WINNERS

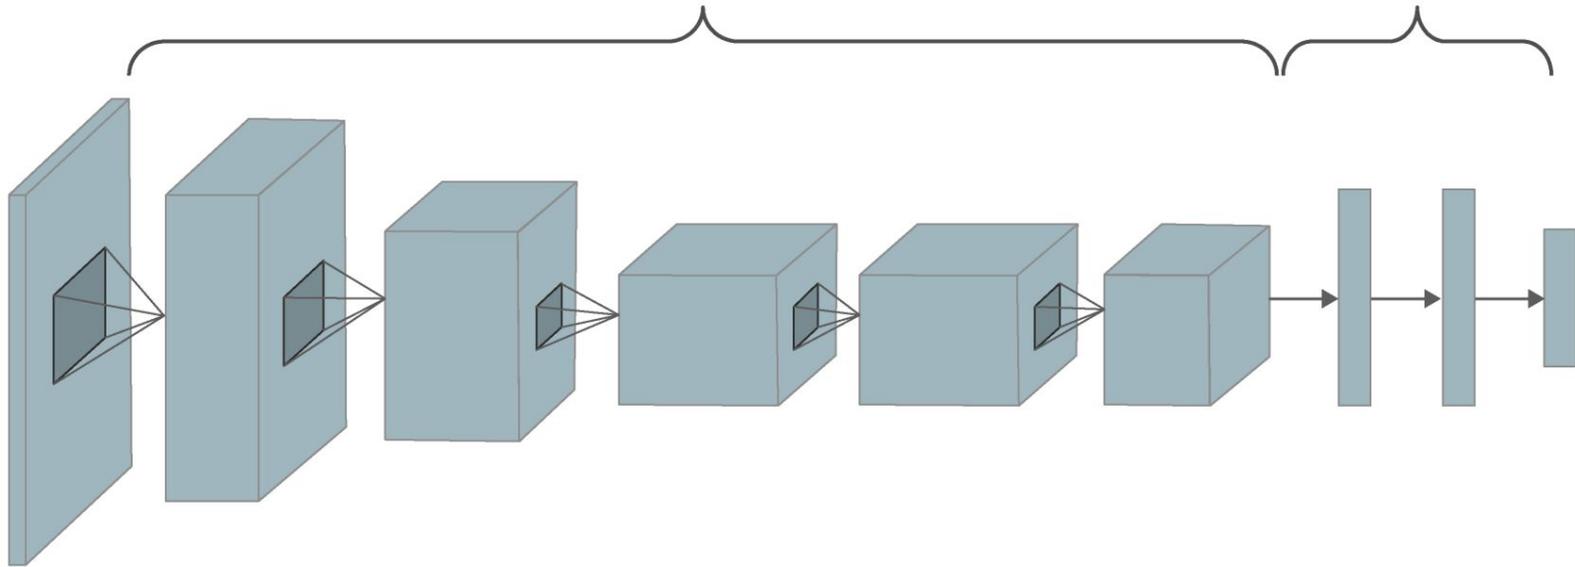

## IMAGENET LARGE SCALE VISUAL RECOGNITION CHALLENGE (ILSVRC) WINNERS

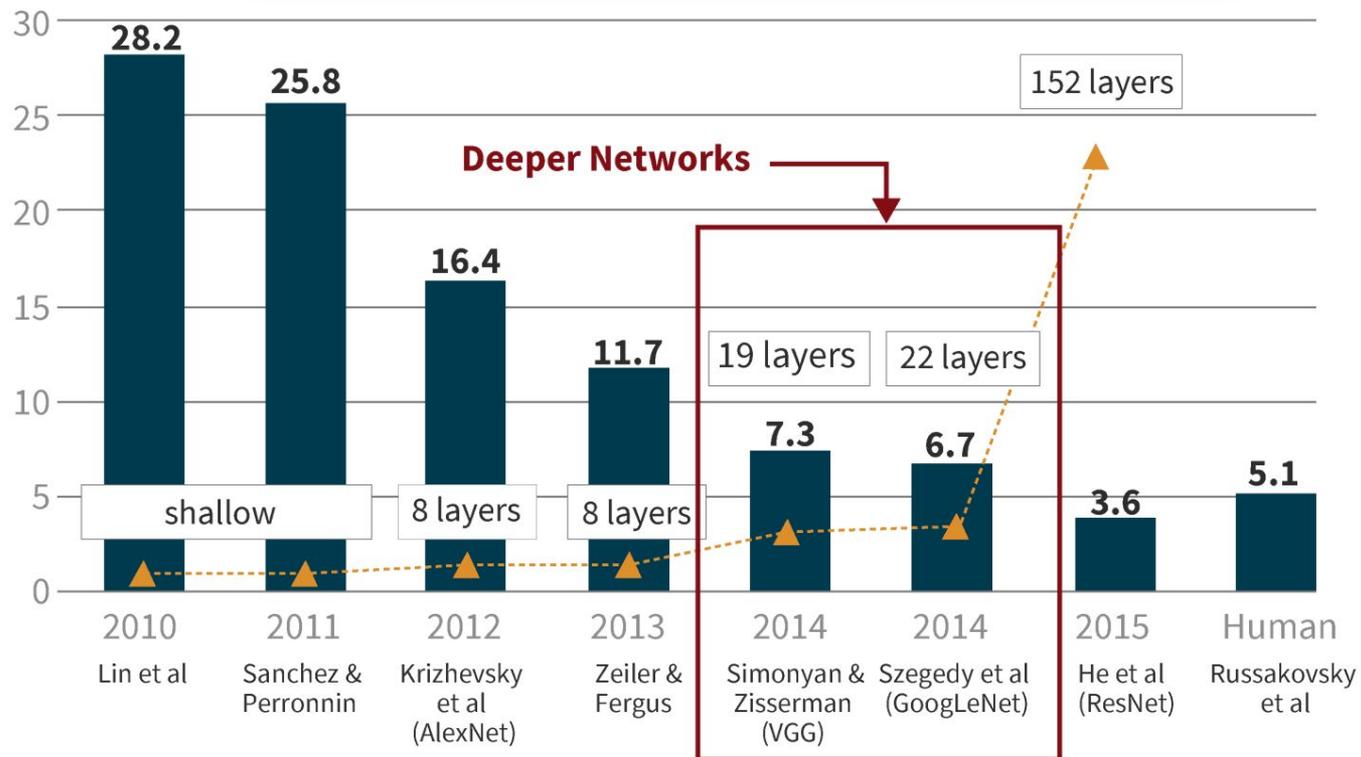

# ALEXNET (2012)

5 convolutional layers

3 fully-connected layers

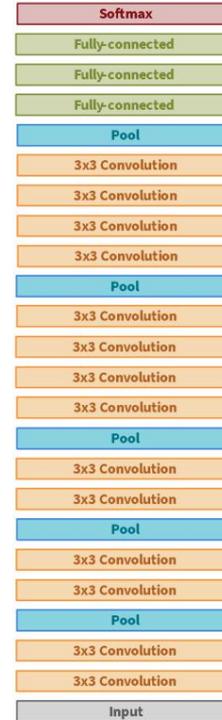

## IMAGENET LARGE SCALE VISUAL RECOGNITION CHALLENGE (ILSVRC) WINNERS

# VGGNET (2014)

Smaller filter sizes (3x3 convolutions)

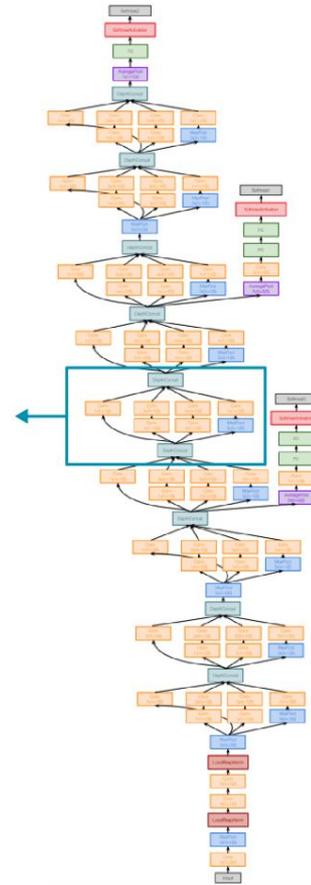

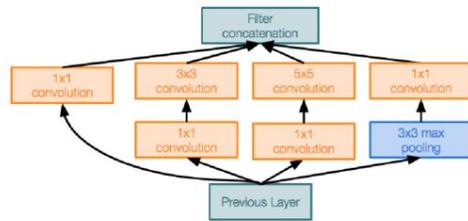

Deeper network (19 layers)

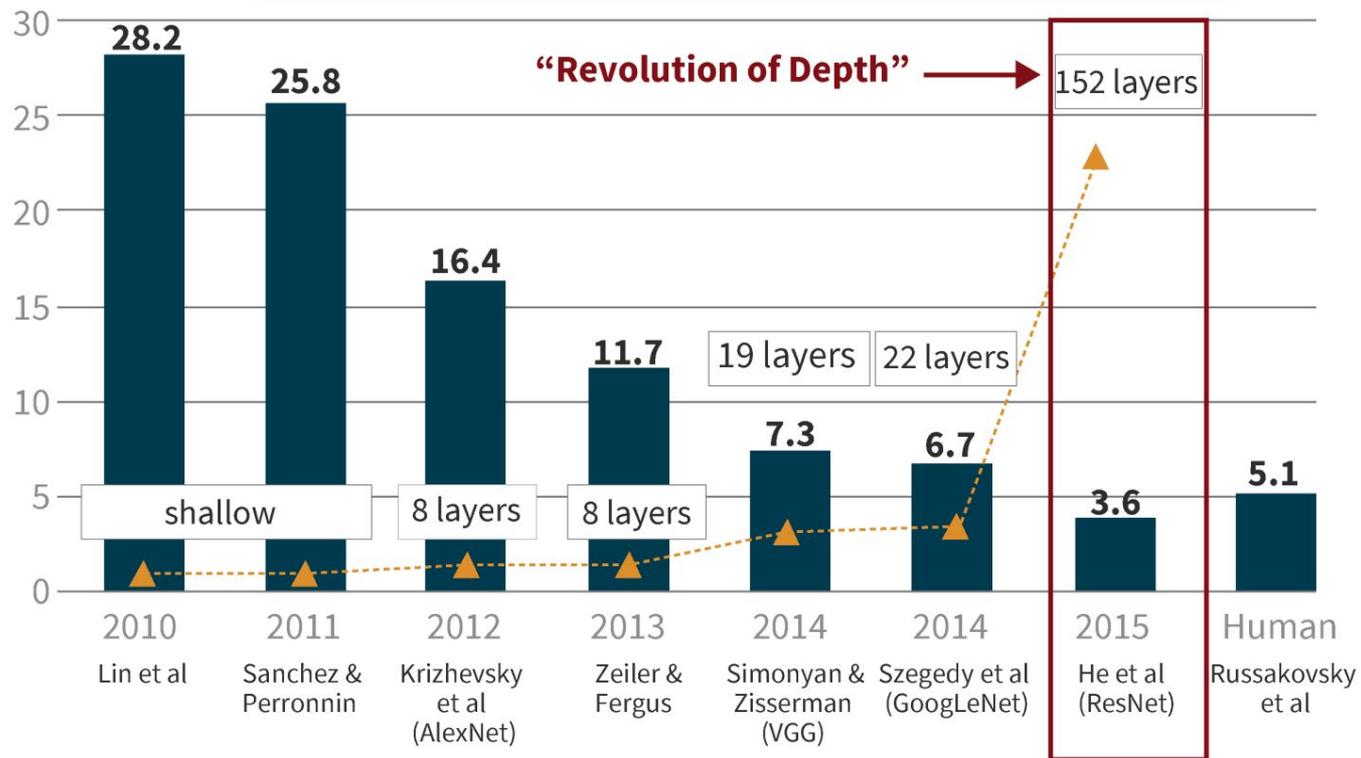

**VGG19**

# GOOGLENET (2014)

Stack of efficient “Inception modules”  
Total depth of 22 layers

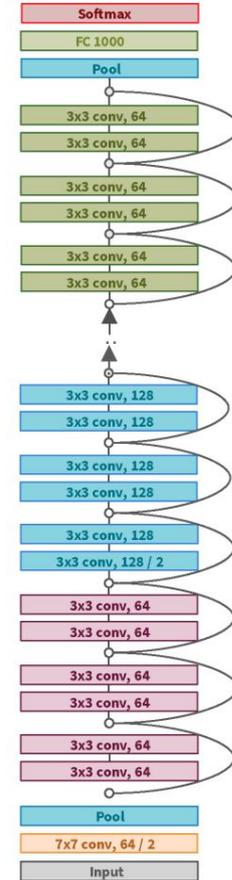

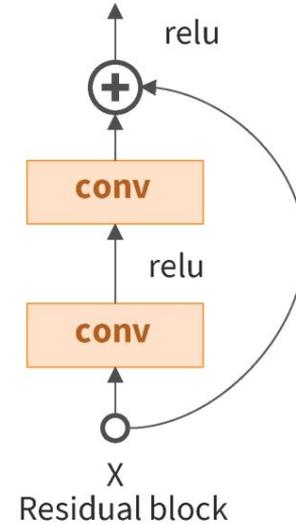

## IMAGENET LARGE SCALE VISUAL RECOGNITION CHALLENGE (ILSVRC) WINNERS

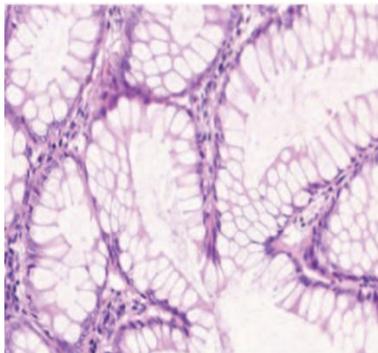

# RESNET (2015)

Stack of residual blocks with skip connections  
Allows easier optimization of loss function to enable very deep networks

# Richer visual recognition tasks: segmentation and detection

## Classification

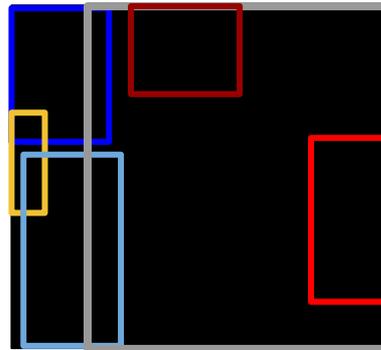

Output:  
one category label for  
image (e.g., colorectal  
glands)

## Semantic Segmentation

Output:  
category label for each pixel  
in the image

## Detection

Output:  
Spatial bounding box for  
each **instance** of a  
category object in the  
image

## Instance Segmentation

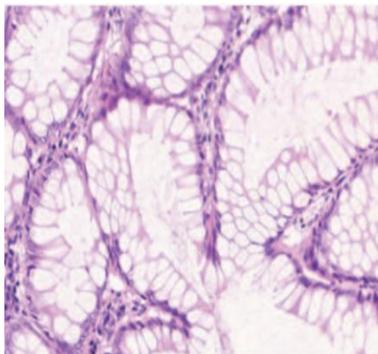

Output:  
Category label and instance  
label for each pixel in the  
image

Figures: Chen et al. 2016. <https://arxiv.org/pdf/1604.02677.pdf>

# Richer visual recognition tasks: segmentation and detection

image

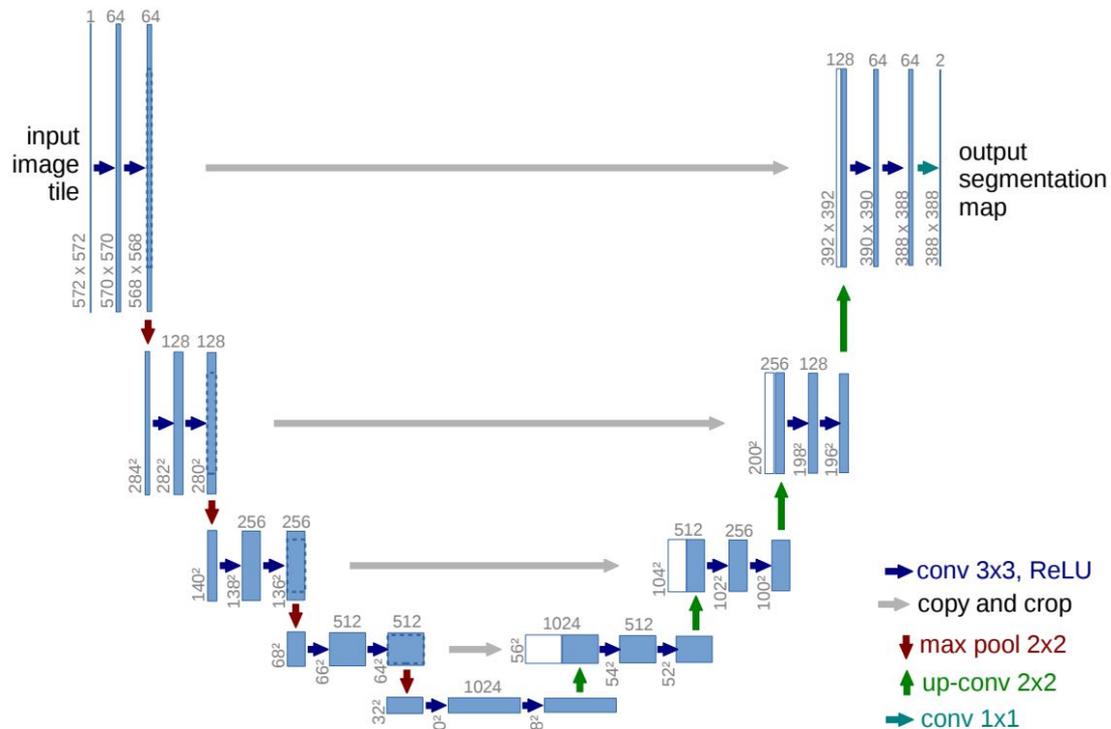

## Instance Segmentation

Output:  
Category label and instance  
label for each pixel in the  
image

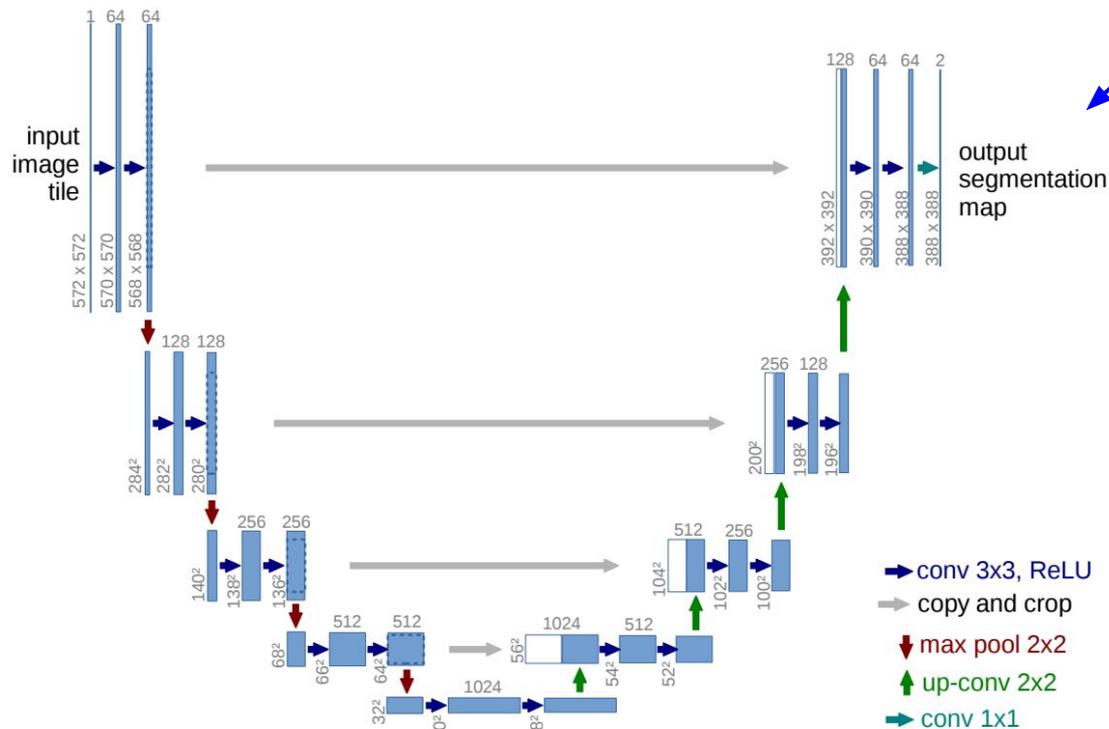

Distinguishes between different instances of an object

# Semantic segmentation: U-Net

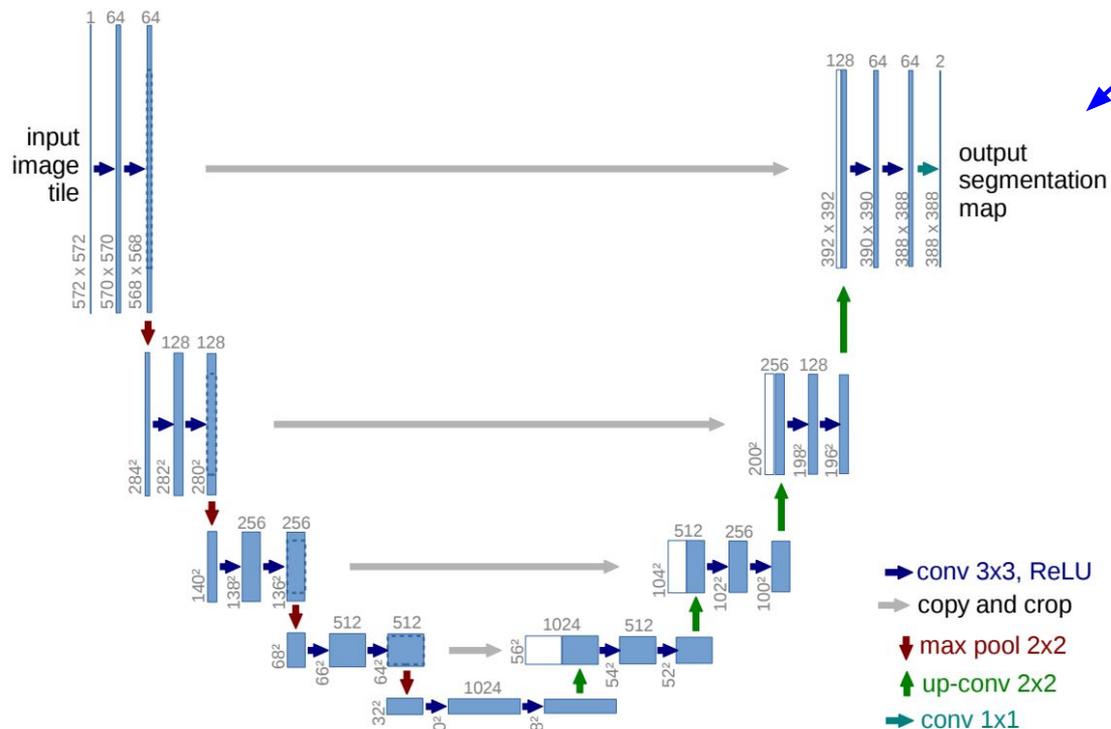

Ronneberger et al. 2015. U-Net: Convolutional Networks for Biomedical Image Segmentation. 2015.

# Semantic segmentation: U-Net

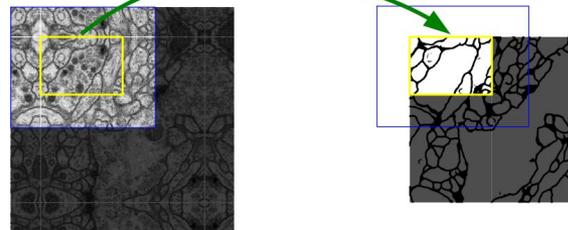

Output is an image mask: width x height x # classes

# Semantic segmentation: U-Net

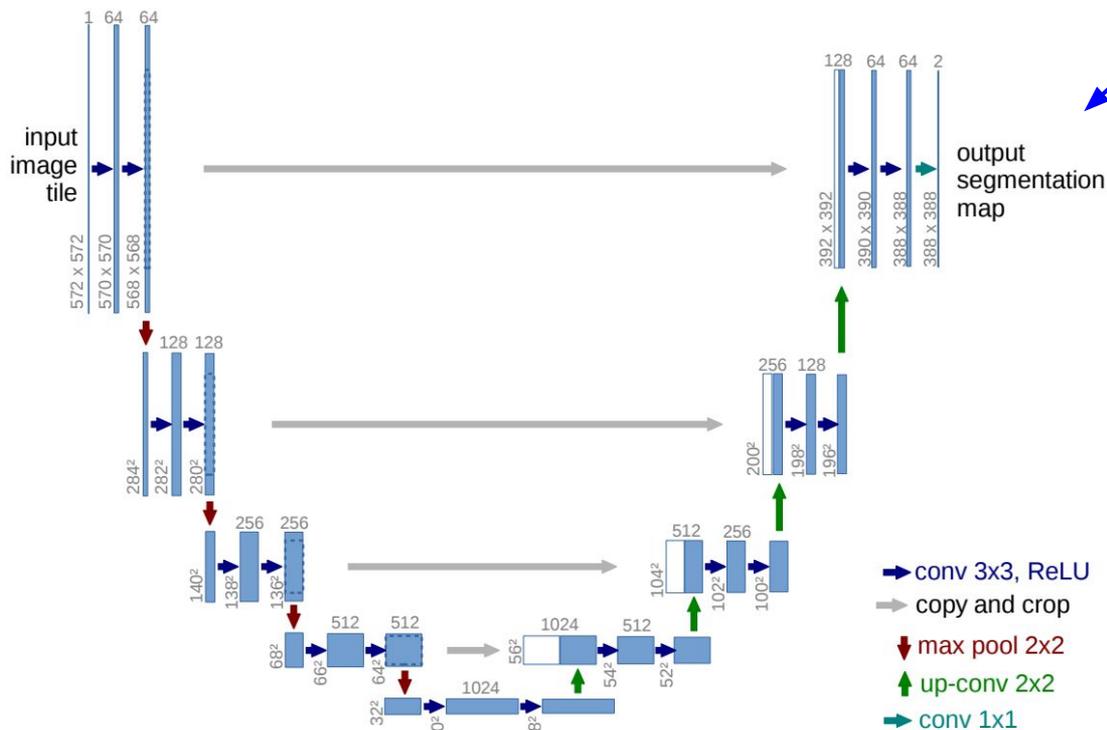

Output is an image mask: width x height x # classes

Output image size a little smaller than original, due to convolutional operations w/o padding

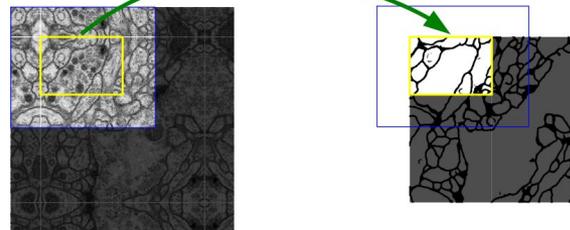

# Semantic segmentation: U-Net

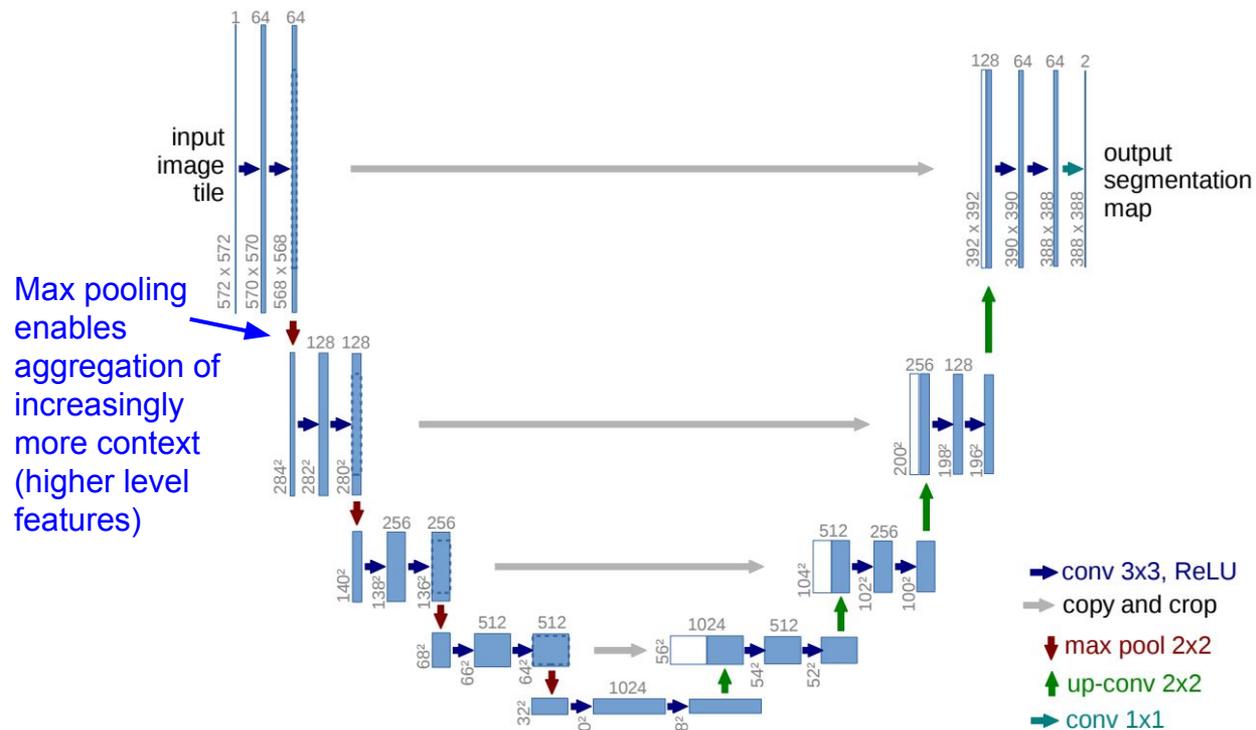

Output is an image mask: width x height x # classes

Output image size a little smaller than original, due to convolutional operations w/o padding

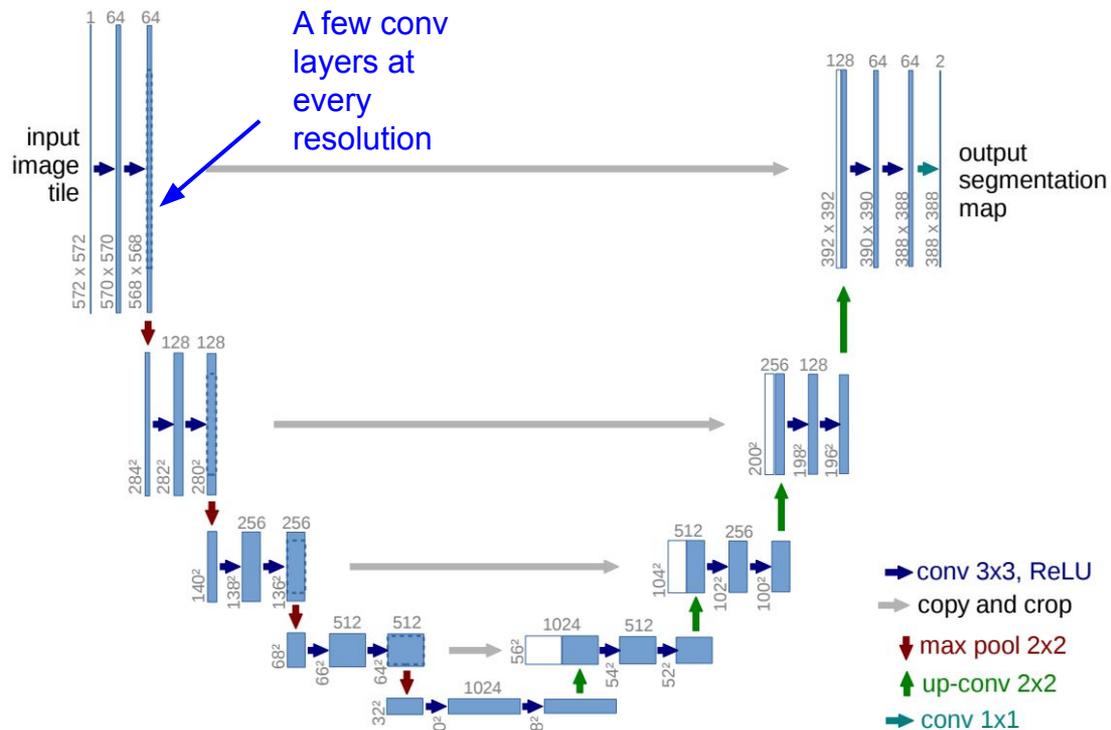

Gives more “true” context for reasoning over each image area. Can tile to make predictions for arbitrarily large images

# Semantic segmentation: U-Net

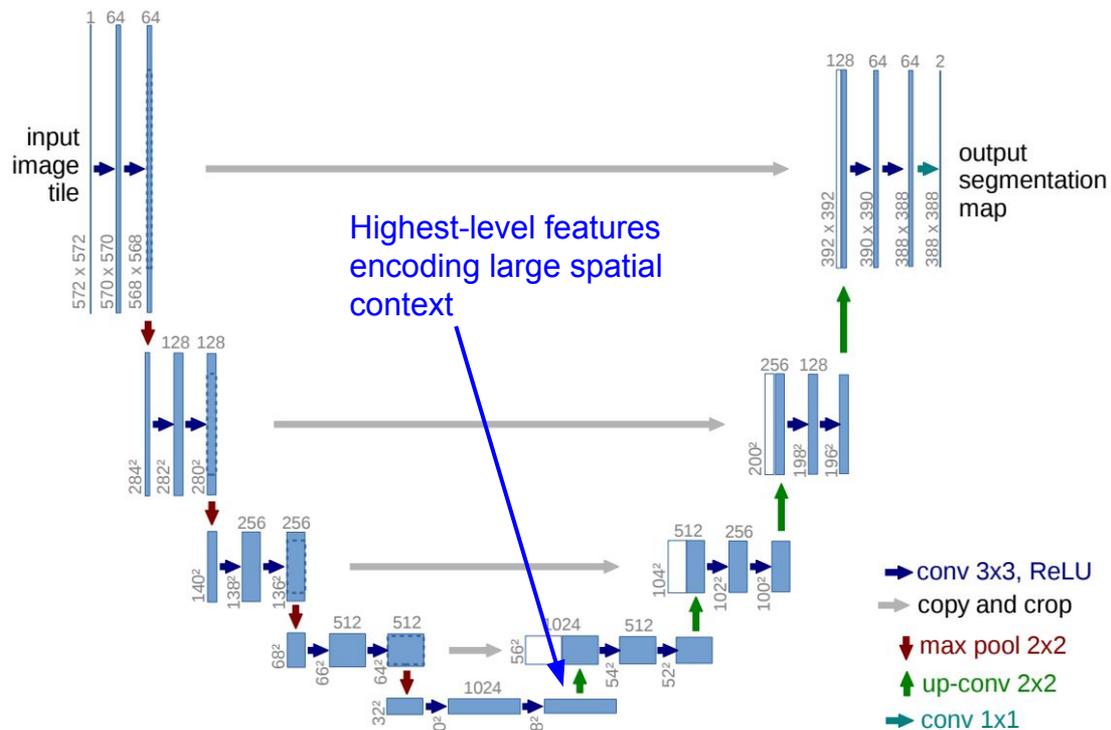

Ronneberger et al. 2015. U-Net: Convolutional Networks for Biomedical Image Segmentation. 2015.

# Semantic segmentation: U-Net

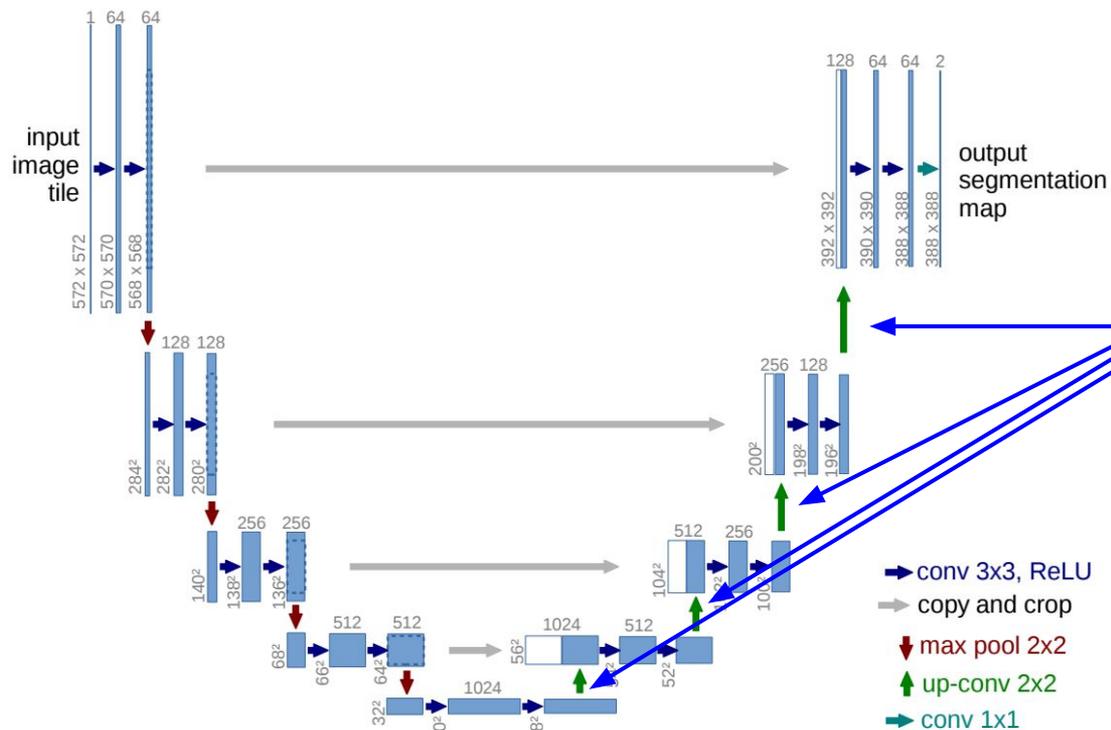

Ronneberger et al. 2015. U-Net: Convolutional Networks for Biomedical Image Segmentation. 2015.

# Semantic segmentation: U-Net

Ronneberger et al. 2015. U-Net: Convolutional Networks for Biomedical Image Segmentation. 2015.

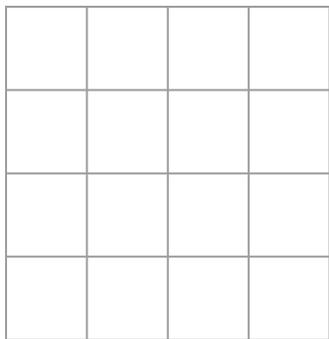

# Semantic segmentation: U-Net

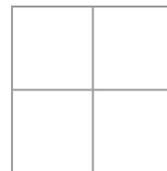

Up-convolutions to go from the global information encoded in highest-level features, back to individual pixel predictions

# Up-convolutions

**Recall:** Normal 3 x 3 convolution, stride 2 pad 1

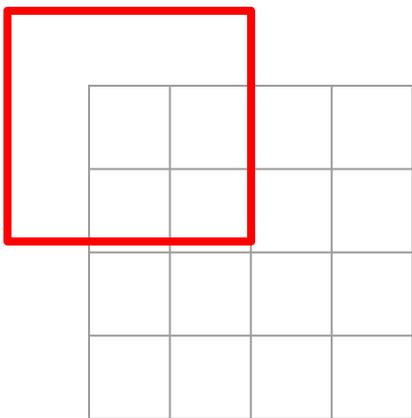

Input: 4 x 4

Output: 2 x 2

# Up-convolutions

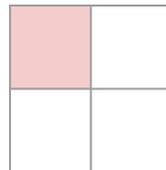

**Recall:** Normal 3 x 3 convolution, stride 2 pad 1

Input: 4 x 4

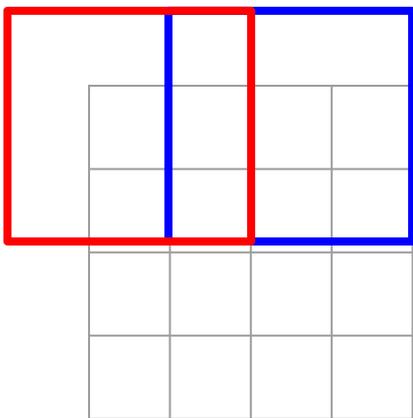

Dot product  
between filter  
and input

Output: 2 x 2

# Up-convolutions

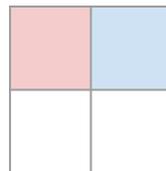

**Recall:** Normal 3 x 3 convolution, stride 2 pad 1

Input: 4 x 4

Element-wise  
multiplication  
between filter  
and input

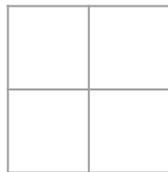

Output: 2 x 2

Filter moves 2 pixels in  
the input for every one  
pixel in the output

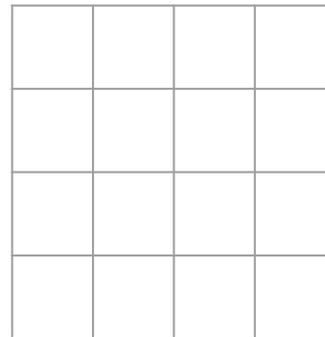

Stride gives ratio between  
movement in input and  
output

# Up-convolutions

3 x 3 **transpose** convolution, stride 2 pad 1

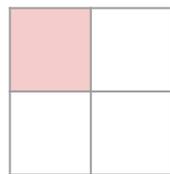

Input: 2 x 2

Output: 4 x 4

# Up-convolutions

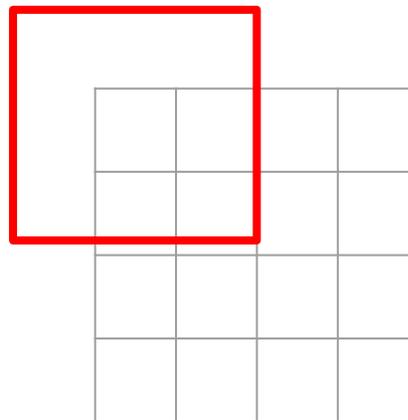

3 x 3 **up-convolution**, stride 2 pad 1

Input: 2 x 2

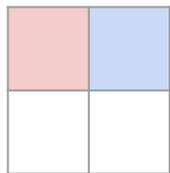

Input gives  
weight for  
filter

Output: 4 x 4

# Up-convolutions

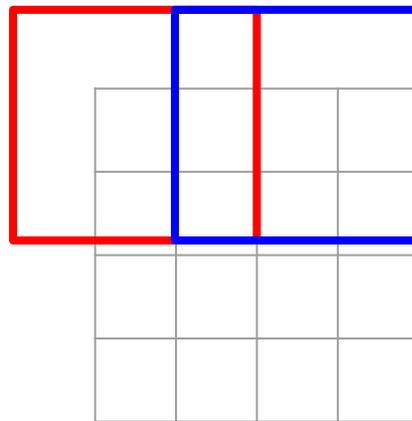

3 x 3 **up-convolution**, stride 2 pad 1

Input: 2 x 2

Input gives  
weight for  
filter

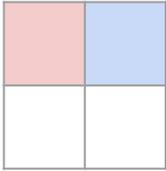

Output: 4 x 4

Filter moves 2 pixels in  
the output for every one  
pixel in the input

Stride gives ratio between  
movement in output and  
input

# Up-convolutions

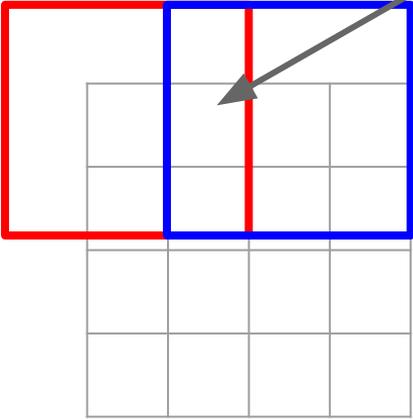

3 x 3 **up-convolution**, stride 2 pad 1

Input: 2 x 2

Input gives weight for filter

Output: 4 x 4

Sum where output overlaps

Filter moves 2 pixels in the output for every one pixel in the input

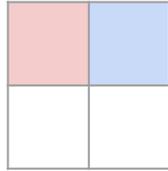

Stride gives ratio between movement in output and input

# Up-convolutions

## Other names:

- Transpose convolution
- Fractionally strided convolution
- Backward strided convolution

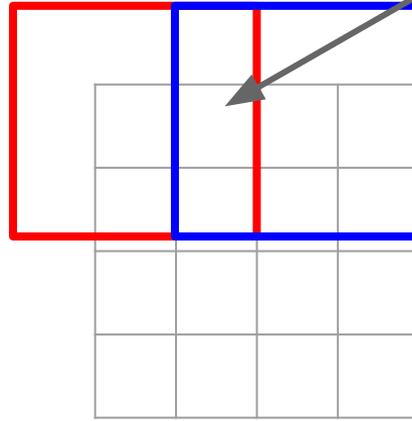

3 x 3 up-convolution, stride 2 pad 1

Input: 2 x 2

Input gives weight for filter

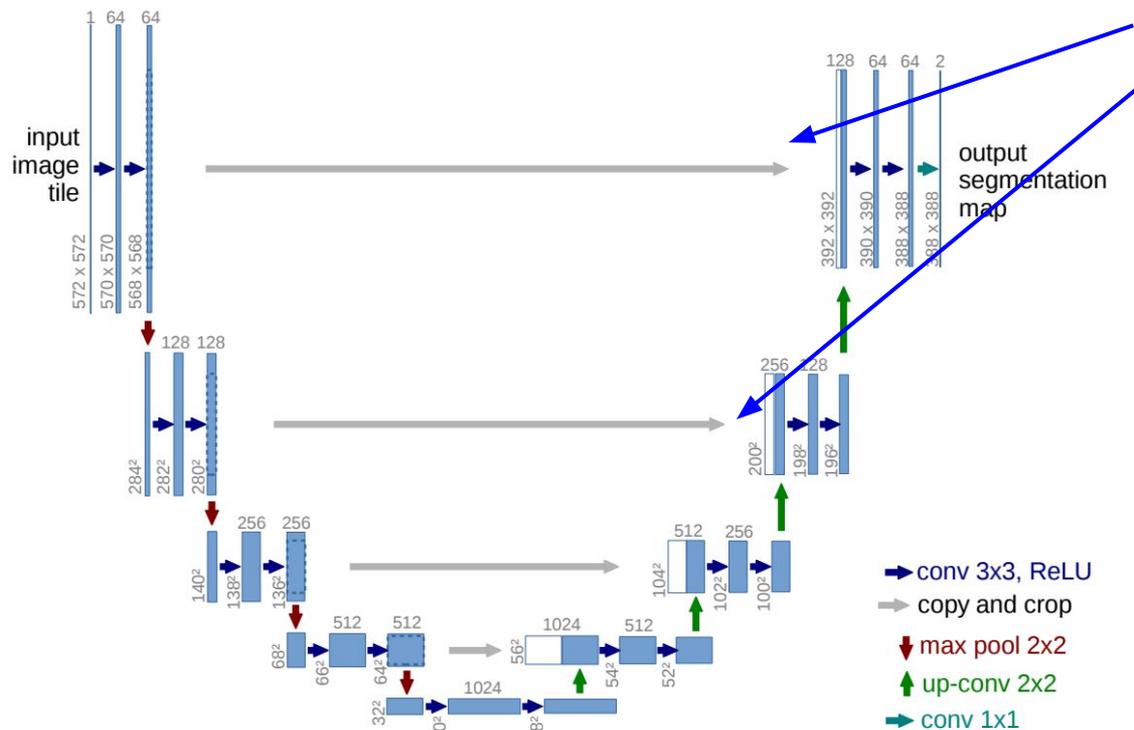

Output: 4 x 4

Sum where output overlaps

Filter moves 2 pixels in the output for every one pixel in the input

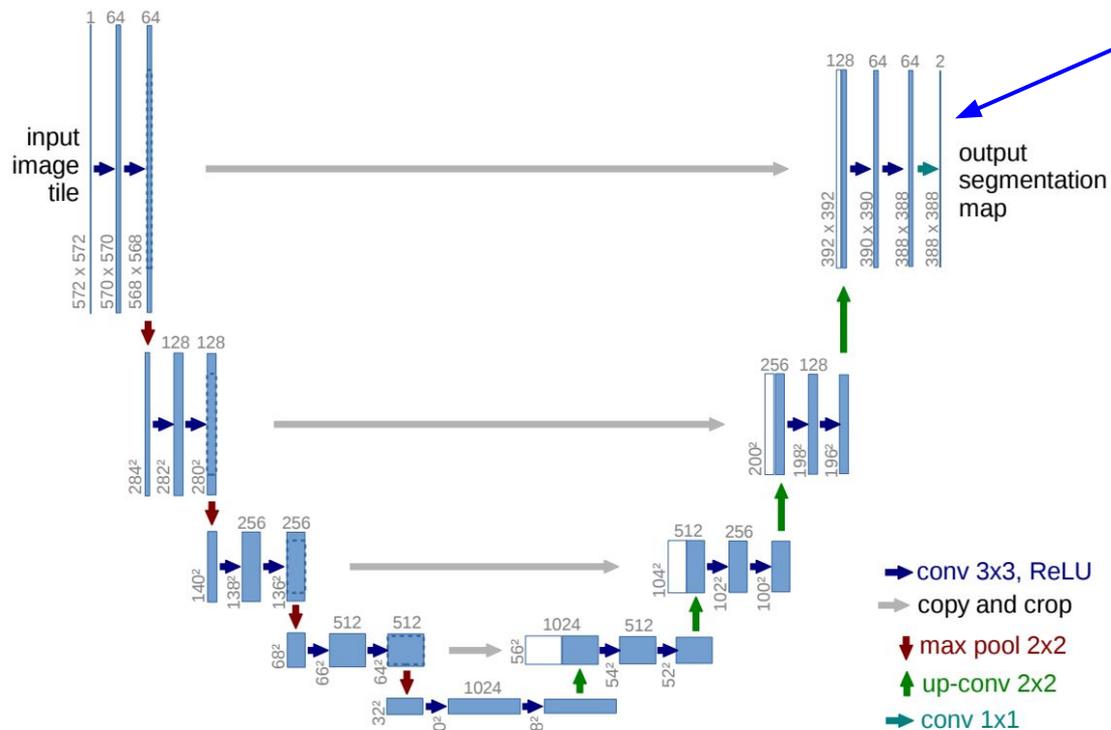

Stride gives ratio between movement in output and input

# Semantic segmentation: U-Net

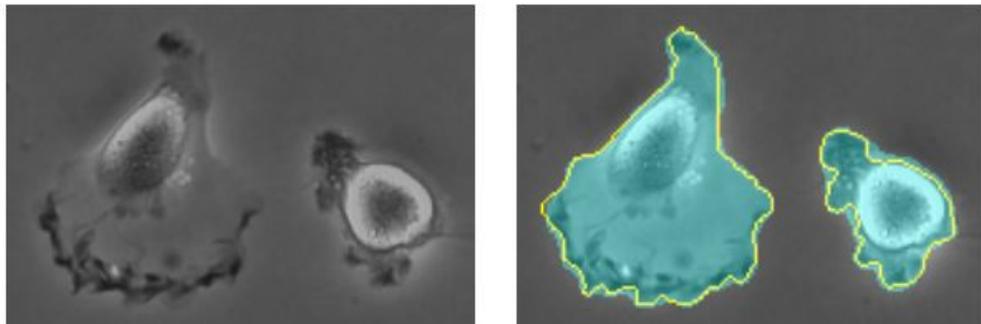

Concatenate with same-resolution feature map during downsampling process to combine high-level information with low-level (local) information

# Semantic segmentation: U-Net

Train with classification loss (e.g. binary cross entropy) on every pixel, sum over all pixels to get total loss

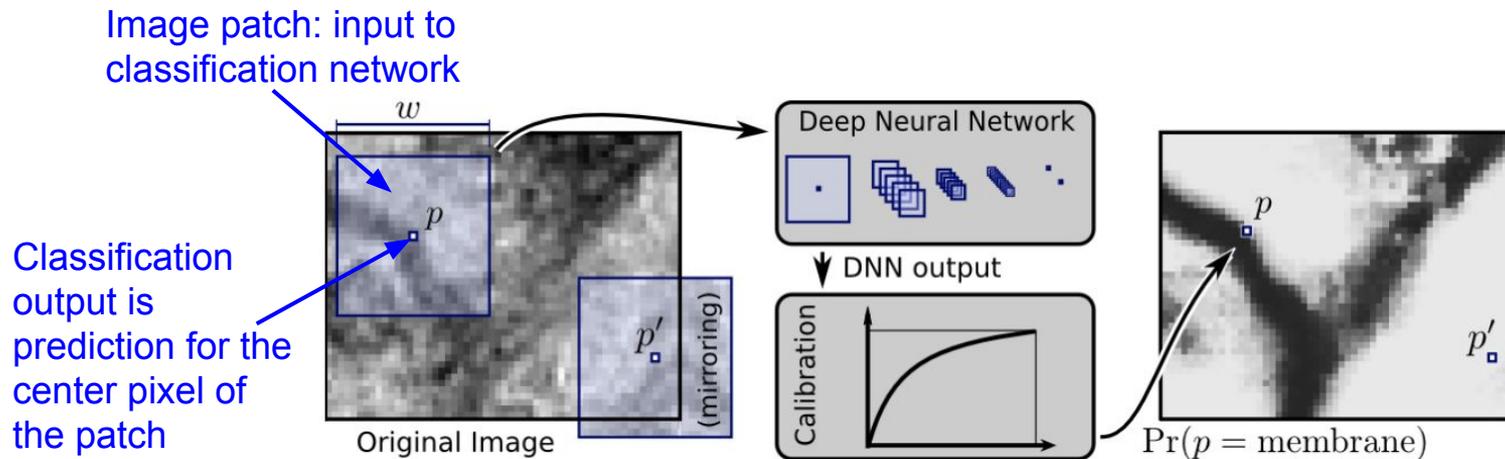

# Semantic segmentation: U-Net cell segmentation

Name	PhC-U373	DIC-HeLa
IMCB-SG (2014)	0.2669	0.2935
KTH-SE (2014)	0.7953	0.4607
HOUS-US (2014)	0.5323	-
second-best 2015	0.83	0.46
u-net (2015)	<b>0.9203</b>	<b>0.7756</b>

Very small dataset: 30 training images of size 512x512, in the ISBI 2012 Electron Microscopy (EM) segmentation challenge. Used excessive data augmentation to compensate.

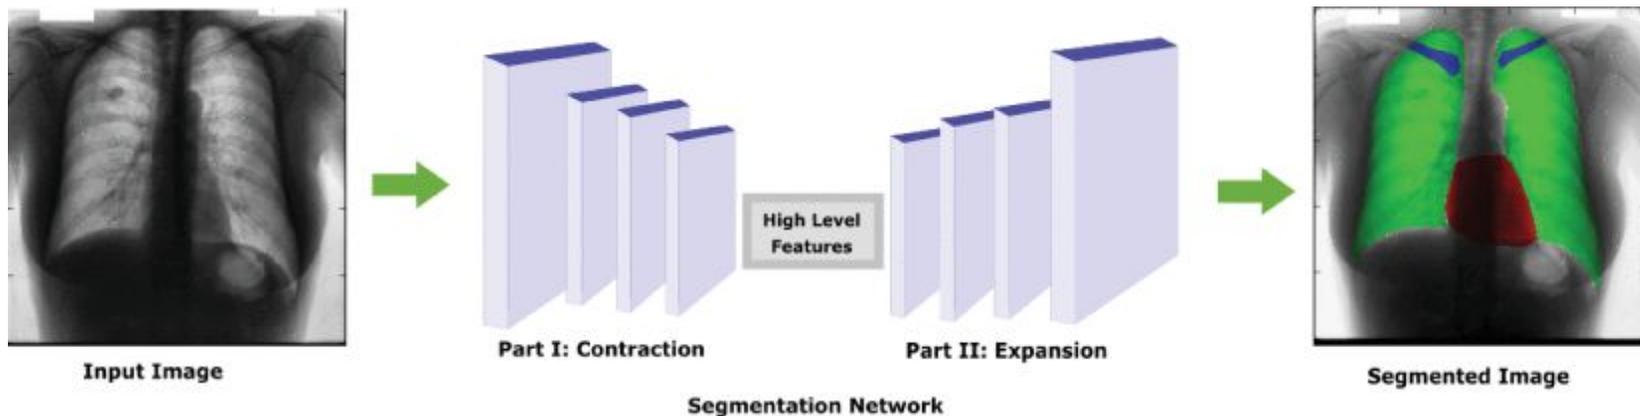

# Aside: segmentation through sliding-window pixel classification

Note: a simple approach to segmentation can also be applying a classification CNN on image patches in a dense, sliding-window fashion (e.g. Ciresan et al.). But fully convolutional approaches such as U-Net generally achieve better performance.

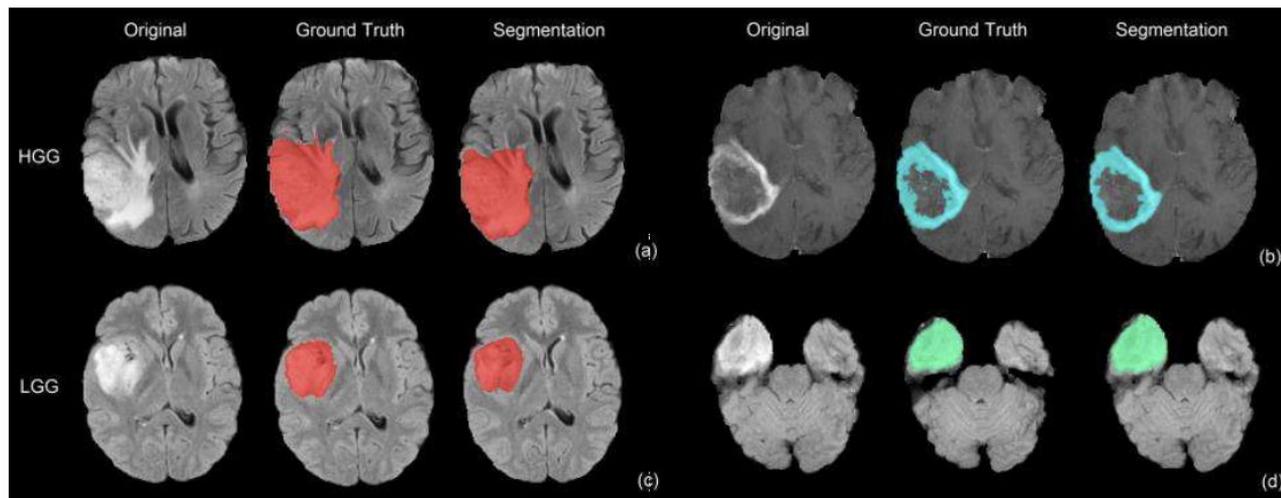

# Novikov et al. 2018

- Chest x-ray segmentation of lungs, clavicles, and heart
- JSRT dataset of 247 chest-xrays at 2048x2048 resolution. (But downsampled to 128x128 and 256x256!)
- Used a U-Net based segmentation network with a few modifications

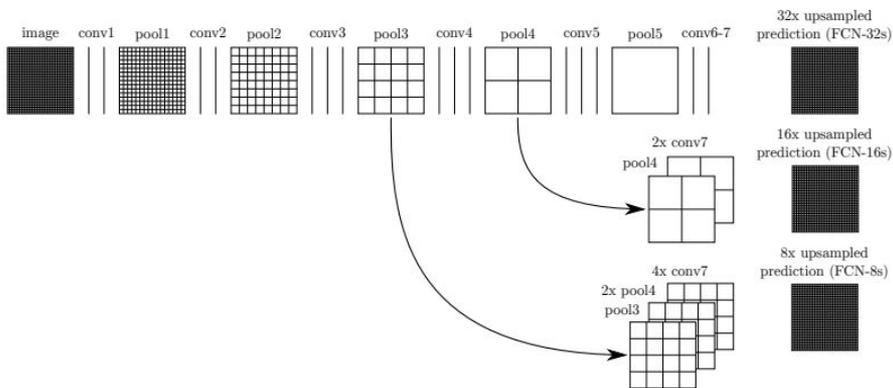

# Dong et al. 2017

- Segmentation of tumors in brain MR image slices
- BRATS 2015 dataset: 220 high-grade brain tumor and 54 low-grade brain tumor MRIs
- U-Net architecture, Dice loss function

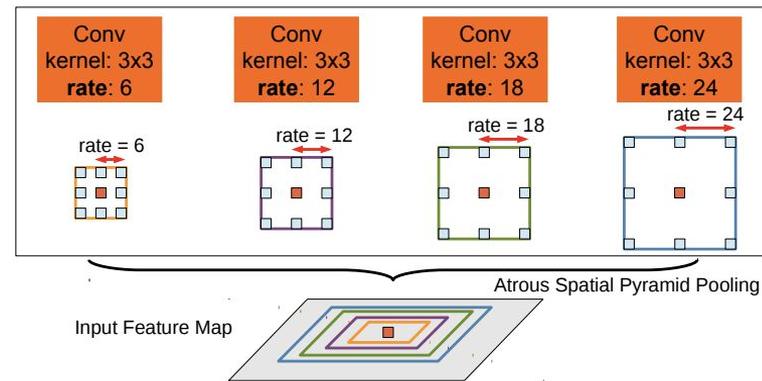

# Other segmentation architectures

- **Fully convolutional networks (FCN)**
- Pre-cursor to U-Net, similar in structure but simpler upsampling pathway

Shelhamer\*, Long\*, et al. Fully Convolutional Networks for Semantic Segmentation. CVPR 2015.

- **DeepLab (v1-v3)**
- Uses “atrous convolutions” to control a filter’s field of view
- Parallel atrous convolutions with different rates for multi-scale features

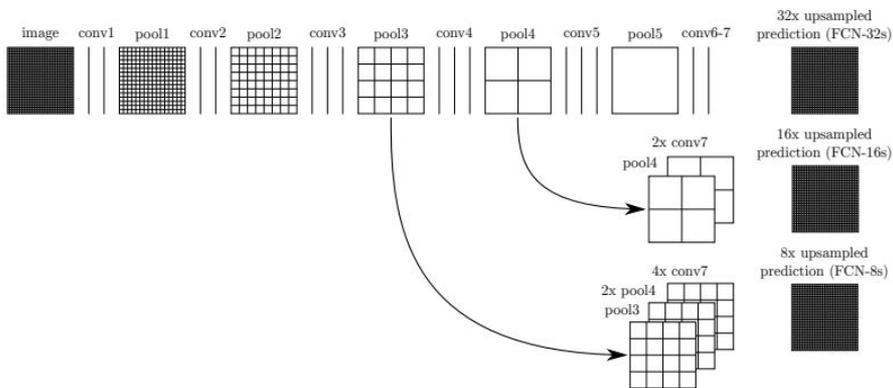

Chen et al. DeepLab: Semantic Image Segmentation with Deep Convolutional Nets, Atrous Convolution, and Fully Connected CRFs. IEEE TPAMI, 2017.

Chen et al. Rethinking Atrous Convolution for Semantic Image Segmentation. 2917.

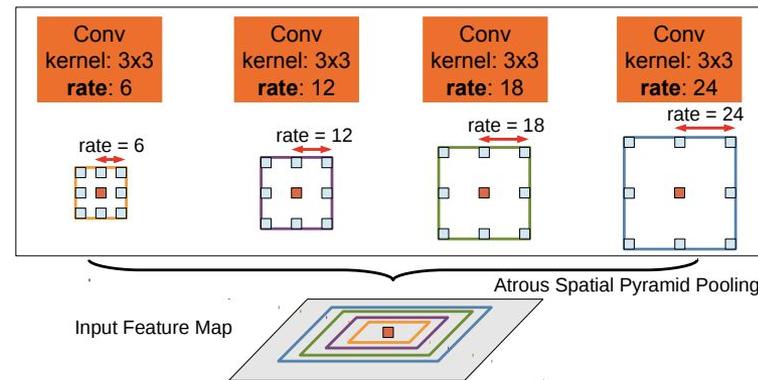

# Other segmentation architectures

Can try DeepLab v3+  
for segmentation  
projects!

- **Fully convolutional networks (FCN)**

# Other object detection architectures

- **RCNN, Fast RCNN**: older and slower predecessors to Faster-RCNN
- **YOLO, SSD**: single-stage detectors that change region proposal generation -> region classification two-stage pipeline into a single stage.
  - Faster, but lower performance. Struggles more with class imbalance relative to two-stage networks that filter only top object candidate boxes for the second stage.
- **RetinaNet**: single-stage detector that uses a “focal loss” to adaptively weight harder examples over easy background examples. Able to outperform Faster R-CNN on some benchmark tasks, while being more efficient.

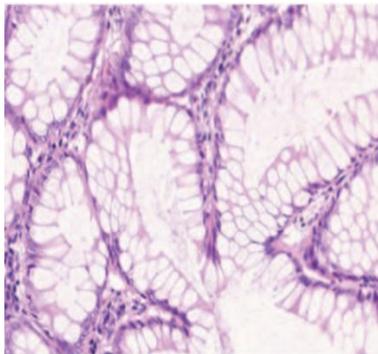

# Other object detection architectures

- **RCNN, Fast RCNN**: older and slower predecessors to Faster-RCNN

Psychology

Either 3D convolutional approaches or recurrent neural network approaches (we have time sequences!) can work

# Detecting patient mobilization activities in the ICU

Get patient  
out of bed

Sit patient  
in chair

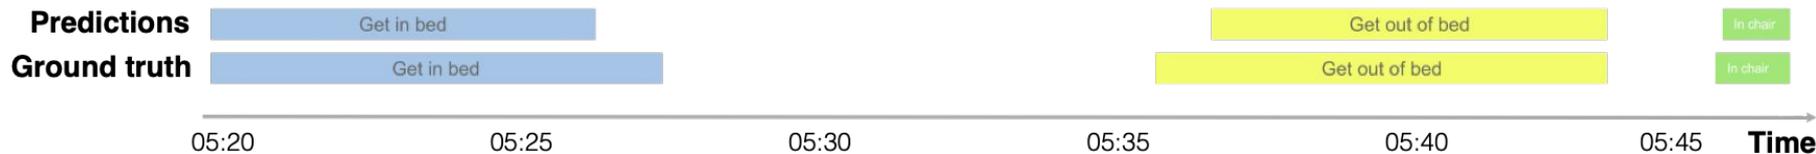

Get patient  
in bed

Get patient  
out of chair

# Detecting patient mobilization activities in the ICU

# Detecting patient mobilization activities in the ICU

**Predictions**

Get out of bed

Get in bed

Get out of bed

**Ground truth**

Get out of bed

Get in bed

Get out of bed

# Summary

Today we covered:

- Recurrent and transformer neural networks for unstructured *text sequence* data
- Neural network architectures for more complex AI tasks

Next time: evaluation metrics for AI in healthcare
