Regular Expressions
Recap from Last Time
Regular Languages

• A language \( L \) is a regular language if there is a DFA \( D \) such that \( \mathcal{L}(D) = L \).

• **Theorem:** The following are equivalent:
  • \( L \) is a regular language.
  • There is a DFA for \( L \).
  • There is an NFA for \( L \).
Language Concatenation

- If $w \in \Sigma^*$ and $x \in \Sigma^*$, then $wx$ is the **concatenation** of $w$ and $x$.

- If $L_1$ and $L_2$ are languages over $\Sigma$, the **concatenation** of $L_1$ and $L_2$ is the language $L_1L_2$ defined as

  $$L_1L_2 = \{ wx \mid w \in L_1 \text{ and } x \in L_2 \}$$

- Example: if $L_1 = \{ a, ba, bb \}$ and $L_2 = \{ aa, bb \}$, then

  $$L_1L_2 = \{ aaa, abb, baaa, babb, bbaa, bbbb \}$$
New Stuff!
Lots and Lots of Concatenation

- Consider the language $L = \{ \text{aa, b} \}$
- $LL$ is the set of strings formed by concatenating pairs of strings in $L$.
  
  \[ \{ \text{aaaa, aab, baa, bb} \} \]
- $LLL$ is the set of strings formed by concatenating triples of strings in $L$.
  
  \[ \{ \text{aaaaaaaa, aaaaab, aabaa, aabb, baaaa, baab, bbaa, bbb} \} \]
- $LLLL$ is the set of strings formed by concatenating quadruples of strings in $L$.
  
  \[ \{ \text{aaaaaaaaa, aaaaaab, aaaaaba, aaaaab, aabaaaaa, aababa, aabaa, aabbb, aabbb, baaaaaa, baaaaab, baabaa, baabb, bbaaaa, bbaab, bbbaa, bbbb} \} \]
Language Exponentiation

- We can define what it means to “exponentiate” a language as follows:
  - \( L^0 = \{ \varepsilon \} \)
    - The set containing just the empty string.
    - Idea: Any string formed by concatenating zero strings together is the empty string.
  - \( L^{n+1} = LL^n \)
    - Idea: Concatenating \((n+1)\) strings together works by concatenating \(n\) strings, then concatenating one more.
- **Question:** Why define \( L^0 = \{ \varepsilon \} \)?
The Kleene Closure

• An important operation on languages is the **Kleene Closure**, which is defined as

\[ L^* = \{ w \in \Sigma^* \mid \exists n \in \mathbb{N}. w \in L^n \} \]

• Mathematically:

\[ w \in L^* \quad \text{iff} \quad \exists n \in \mathbb{N}. w \in L^n \]

• Intuitively, all possible ways of concatenating zero or more strings in \( L \) together, possibly with repetition.
The Kleene Closure

If $L = \{a, \text{bb}\}$, then $L^* = \{
\varepsilon, 
a, \text{bb}, 
\text{aa}, \text{abb}, \text{bba}, \text{bbbb}, 
\text{aaa}, \text{aabb}, \text{abba}, \text{abbbb}, \text{bbaa}, \text{bbabb}, \text{bbbaa}, \text{bbbbbb}, \ldots
\}$

Think of $L^*$ as the set of strings you can make if you have a collection of stamps – one for each string in $L$ – and you form every possible string that can be made from those stamps.
Reasoning about Infinity

• If $L$ is regular, is $L^*$ necessarily regular?
• ⚠ A Bad Line of Reasoning: ⚠
  • $L^0 = \{ \varepsilon \}$ is regular.
  • $L^1 = L$ is regular.
  • $L^2 = LL$ is regular
  • $L^3 = L(LL)$ is regular
  • ...
  • Regular languages are closed under union.
  • So the union of all these languages is regular.

∞ is finite
Reasoning about Infinity

\[ \infty \text{ is finite} \]  
\[ \wedge \text{ not} \]
Reasoning About the Infinite

• If a series of finite objects all have some property, the “limit” of that process does not necessarily have that property.
• In general, it is not safe to conclude that some property that always holds in the finite case must hold in the infinite case.
  • (This is why calculus is interesting).
**Idea:** Can we directly convert an NFA for language $L$ to an NFA for language $L^*$?

Question: Why add the new state out front? Why not just make the old start state accepting?
Closure Properties

- **Theorem:** If $L_1$ and $L_2$ are regular languages over an alphabet $\Sigma$, then so are the following languages:
  - $\overline{L}_1$
  - $L_1 \cup L_2$
  - $L_1 \cap L_2$
  - $L_1L_2$
  - $L_1^*$

- These properties are called **closure properties of the regular languages**.
Another View of Regular Languages
Rethinking Regular Languages

• We currently have several tools for showing a language is regular.
  • Construct a DFA for it.
  • Construct an NFA for it.
  • Apply closure properties to existing languages.

• We have not spoken much of this last idea.
Constructing Regular Languages

- **Idea:** Build up all regular languages as follows:
  - Start with a small set of simple languages we already know to be regular.
  - Using closure properties, combine these simple languages together to form more elaborate languages.
- A *bottom-up approach to the regular languages.*
Constructing Regular Languages

- **Idea:** Build up all regular languages as follows:
  - Start with a small set of simple languages we already know to be regular.
  - Using closure properties, combine these simple languages to form more elaborate languages.
- A bottom-up approach to the regular languages.
Regular Expressions

- **Regular expressions** are a way of describing a language via a string representation.

- Used extensively in software systems for string processing and as the basis for tools like `grep` and `flex`.

- Conceptually, regular languages are strings describing how to assemble a larger language out of smaller pieces.
Atomic Regular Expressions

- The regular expressions begin with three simple building blocks.
- The symbol $\emptyset$ is a regular expression that represents the empty language $\emptyset$.
- For any $a \in \Sigma$, the symbol $a$ is a regular expression for the language $\{a\}$.
- The symbol $\varepsilon$ is a regular expression that represents the language $\{\varepsilon\}$.
  - Remember: $\{\varepsilon\} \neq \emptyset$!
  - Remember: $\{\varepsilon\} \neq \varepsilon$!
Compound Regular Expressions

- If $R_1$ and $R_2$ are regular expressions, $R_1R_2$ is a regular expression for the *concatenation* of the languages of $R_1$ and $R_2$.
- If $R_1$ and $R_2$ are regular expressions, $R_1 \cup R_2$ is a regular expression for the *union* of the languages of $R_1$ and $R_2$.
- If $R$ is a regular expression, $R^*$ is a regular expression for the *Kleene closure* of the language of $R$.
- If $R$ is a regular expression, $(R)$ is a regular expression with the same meaning as $R$. 
Operator Precedence

• Regular expression operator precedence:
  
  \((R)\)
  
  \(R^*\)
  
  \(R_1R_2\)
  
  \(R_1 \cup R_2\)
  
• So \(ab*c \cup d\) is parsed as \(((a(b*))c) \cup d\)
Regular Expression Examples

• The regular expression `trick ∪ treat` represents the regular language `{ trick, treat }`.

• The regular expression `booo*` represents the regular language `{ boo, booo, boooo, ... }`.

• The regular expression `candy!(candy!)*` represents the regular language `{ candy!, candy!candy!, candy!candy!candy!, ... }`. 
The language of a regular expression is the language described by that regular expression. Formally:

- $\mathcal{L}(\varepsilon) = \{\varepsilon\}$
- $\mathcal{L}(\emptyset) = \emptyset$
- $\mathcal{L}(a) = \{a\}$
- $\mathcal{L}(R_1 R_2) = \mathcal{L}(R_1) \mathcal{L}(R_2)$
- $\mathcal{L}(R_1 \cup R_2) = \mathcal{L}(R_1) \cup \mathcal{L}(R_2)$
- $\mathcal{L}(R^*) = \mathcal{L}(R)^*$
- $\mathcal{L}((R)) = \mathcal{L}(R)$

Worthwhile activity: Apply this recursive definition to $a(b\cup c)((d))$ and see what you get.
Designing Regular Expressions

- Let $\Sigma = \{0, 1\}$
- Let $L = \{w \in \Sigma^* \mid w$ contains $00$ as a substring $\}$
Designing Regular Expressions

- Let $\Sigma = \{0, 1\}$
- Let $L = \{ w \in \Sigma^* \mid w \text{ contains } 00 \text{ as a substring} \}$

$$(0 \cup 1)^*00(0 \cup 1)^*$$
Designing Regular Expressions

- Let $\Sigma = \{0, 1\}$
- Let $L = \{ w \in \Sigma^* \mid w$ contains $00$ as a substring $\}$

$$(0 \cup 1)^*00(0 \cup 1)^*$$
Designing Regular Expressions

• Let $\Sigma = \{0, 1\}$

• Let $L = \{ w \in \Sigma^* \mid w$ contains $00$ as a substring $\}$

Problem Sets

- Problem Set Five was due at the start of today’s lecture.
  - Need more time? Use your 24-hour late days!
- Problem Set Six goes out today. It’s due next Friday at the start of class.
  - Design DFAs and NFAs for various languages!
  - Explore properties of formal language theory!
  - See applications of the concepts!
Problem Set Four

- Problem Set Four is now graded. Here’s the score distribution:

- As always, feel free to stop by office hours to discuss your problem sets or the feedback. We’re happy to help out!
Your Questions
“what do the numberings of the handouts mean”

They’re numbered sequentially. Anything ending in an S is a solutions set, anything in C is a checkpoint solutions set, and anything in an R is a regrade form.
“Why did you delete a top-ranking question about handout numbers?”

Oops. I didn’t mean to do that. Sorry!
“What is Stanford CS doing increase faculty diversity? (in terms of gender, race, class, etc.)”

We’ve significantly stepped up efforts to address this recently. I’ll take this one in class.
Back to CS103!
The Power of Regular Expressions

**Theorem:** If $R$ is a regular expression, then $\mathcal{L}(R)$ is regular.

**Proof idea:** Use induction!

- The atomic regular expressions all represent regular languages.
- The combination steps represent closure properties.
- So anything you can make from them must be regular!
Thompson’s Algorithm

• In practice, many regex matchers use an algorithm called *Thompson's algorithm* to convert regular expressions into NFAs (and, from there, to DFAs).
  • Read Sipser if you’re curious!

• **Fun fact:** the “Thompson” here is Ken Thompson, one of the co-inventors of Unix!
The Power of Regular Expressions

**Theorem:** If $L$ is a regular language, then there is a regular expression for $L$.

*This is not obvious!*

**Proof idea:** Show how to convert an arbitrary NFA into a regular expression.
Generalizing NFAs
Generalizing NFAs
Generalizing NFAs

These are all regular expressions!
Generalizing NFAs

```plaintext
q_0 \quad \text{start} \quad \{ab \cup b\} \quad q_1

\text{a} \quad q_2 \quad \text{a*b?a*} \quad q_3

\text{a a a b a a a b b b b}
```
Generalizing NFAs

\[ \begin{array}{c}
q_0 & \xrightarrow{ab \cup b} & q_1 \\
q_2 & \xrightarrow{a*?a^*} & q_3 \\
\end{array} \]

Input sequence: \( a\ a\ a\ b\ a\ a\ b\ b\ b\ b \)
**Key Idea 1:** Imagine that we can label transitions in an NFA with arbitrary regular expressions.
Generalizing NFAs
Generalizing NFAs

Is there a simple regular expression for the language of this generalized NFA?
Generalizing NFAs

Is there a simple regular expression for the language of this generalized NFA?
Generalizing NFAs
Generalizing NFAs

Is there a simple regular expression for the language of this generalized NFA?
Generalizing NFAs

Is there a simple regular expression for the language of this generalized NFA?
**Key Idea 2:** If we can convert an NFA into a generalized NFA that looks like this...

...then we can easily read off a regular expression for that NFA.
From NFAs to Regular Expressions
From NFAs to Regular Expressions

Here, $R_{11}$, $R_{12}$, $R_{21}$, and $R_{22}$ are arbitrary regular expressions.
Question: Can we get a clean regular expression from this NFA?
From NFAs to Regular Expressions

Key Idea 3: Somehow transform this NFA so that it looks like this:
The first step is going to be a bit weird...
From NFAs to Regular Expressions

\[ q_s \xrightarrow{\text{start}} q_1 \xrightarrow{R_{12}} q_2 \xrightarrow{R_{22}} q_f \]
From NFAs to Regular Expressions

\[
\begin{array}{c}
\text{start} \rightarrow q_s \rightarrow q_1 \rightarrow q_2 \rightarrow q_f
\end{array}
\]

\[
\begin{array}{c}
R_{11} \quad R_{12} \quad R_{21} \quad R_{22}
\end{array}
\]

\[
\begin{array}{c}
\varepsilon \quad \varepsilon
\end{array}
\]

From NFAs to Regular Expressions
Could we eliminate this state from the NFA?
From NFAs to Regular Expressions
From NFAs to Regular Expressions
From NFAs to Regular Expressions

Note: We’re using concatenation and Kleene closure in order to skip this state.
From NFAs to Regular Expressions

\[ \varepsilon \, R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[ \varepsilon R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[ \epsilon R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[
\varepsilon R_{11}^* R_{12}
\]

\[
R_{21} R_{11}^* R_{12}
\]
From NFAs to Regular Expressions

\[
\varepsilon R_{11} \ast R_{12}
\]
From NFAs to Regular Expressions

\[ \varepsilon R_{11} \ast R_{12} \]

\[ R_{21} R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[ R_{11} \cdot R_{12} \]

\[ R_{22} \]

\[ R_{21} \cdot R_{11} \cdot R_{12} \]
From NFAs to Regular Expressions

\[ R_{11} \ast R_{12} \]

\[ R_{22} \cup R_{21} R_{11} \ast R_{12} \]

Note: We're using union to combine these transitions together.
From NFAs to Regular Expressions

\[ R_{11} \land R_{12} \land R_{22} \lor R_{21} \land R_{11} \land R_{12} \]
From NFAs to Regular Expressions

\[ R_{11} \ast R_{12} \]

\[ R_{22} \cup R_{21} R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[ q_s \xrightarrow{R_{11} \ast R_{12}} q_2 \xrightarrow{\varepsilon} q_f \]

\[ R_{22} \cup R_{21} R_{11} \ast R_{12} \]
From NFAs to Regular Expressions

\[
q_s \xrightarrow{R_{11} \ast R_{12}} q_2 \xrightarrow{\varepsilon} q_f
\]

\[
R_{22} \cup R_{21} R_{11} \ast R_{12}
\]
From NFAs to Regular Expressions

\[ R_{11} \ast R_{12} \left( R_{22} \cup R_{21} R_{11} \ast R_{12} \right) \ast \varepsilon \]
From NFAs to Regular Expressions

\[ R_{11} \ast R_{12} \ (R_{22} \cup R_{21} R_{11} \ast R_{12})^* \varepsilon \]
From NFAs to Regular Expressions

\[ R_{11}^* R_{12} (R_{22} \cup R_{21} R_{11}^* R_{12})^* \varepsilon \]
From NFAs to Regular Expressions

\[ R_{11}^* R_{12} (R_{22} \cup R_{21} R_{11}^* R_{12} )^* \]
From NFAs to Regular Expressions

\[ q_s \xrightarrow{R_{11} \ast R_{12} \ (R_{22} \cup R_{21} R_{11} \ast R_{12})^*} q_f \]
From NFAs to Regular Expressions

\[ \text{start} \rightarrow q_s \xrightarrow{R_{11}^* R_{12}} (R_{22} \cup R_{21} R_{11}^* R_{12})^* \rightarrow q_f \]

\[ \text{start} \rightarrow q_1 \xrightarrow{R_{11}} R_{12} \xrightarrow{R_{21}} q_2 \xrightarrow{R_{22}} \]

\[ \text{start} \rightarrow q_s \xrightarrow{R_{11}^* R_{12}} (R_{22} \cup R_{21} R_{11}^* R_{12})^* \rightarrow q_f \]

\[ \text{start} \rightarrow q_1 \xrightarrow{R_{11}} R_{12} \xrightarrow{R_{21}} q_2 \xrightarrow{R_{22}} \]
The Construction at a Glance

- Start with an NFA $N$ for the language $L$.
- Add a new start state $q_s$ and accept state $q_f$ to the NFA.
  - Add an $\varepsilon$-transition from $q_s$ to the old start state of $N$.
  - Add $\varepsilon$-transitions from each accepting state of $N$ to $q_f$, then mark them as not accepting.
- Repeatedly remove states other than $q_s$ and $q_f$ from the NFA by “shortcutting” them until only two states remain: $q_s$ and $q_f$.
- The transition from $q_s$ to $q_f$ is then a regular expression for the NFA.
Eliminating a State

To eliminate a state $q$ from the automaton, do the following for each pair of states $q_0$ and $q_1$, where there's a transition from $q_0$ into $q$ and a transition from $q$ into $q_1$:

- Let $R_{in}$ be the regex on the transition from $q_0$ to $q$.
- Let $R_{out}$ be the regex on the transition from $q$ to $q_1$.
- If there is a regular expression $R_{stay}$ on a transition from $q$ to itself, add a new transition from $q_0$ to $q_1$ labeled $(R_{in} (R_{stay})^* R_{out})$.
- If there isn't, add a new transition from $q_0$ to $q_1$ labeled $(R_{in} R_{out})$.
- If a pair of states has multiple transitions between them labeled $R_1, R_2, ..., R_k$, replace them with a single transition labeled $R_1 \cup R_2 \cup ... \cup R_k$. 
Our Transformations

DFA → NFA
- direct conversion

NFA → Regexp
- state elimination
- subset construction
- Thompson's algorithm
**Theorem:** The following are all equivalent:

- $L$ is a regular language.
- There is a DFA $D$ such that $\mathcal{L}(D) = L$.
- There is an NFA $N$ such that $\mathcal{L}(N) = L$.
- There is a regular expression $R$ such that $\mathcal{L}(R) = L$. 
Why This Matters

• The equivalence of regular expressions and finite automata has practical relevance.
  • Tools like `grep` and `flex` that use regular expressions capture all the power available via DFAs and NFAs.

• This also is hugely theoretically significant: the regular languages can be assembled “from scratch” using a small number of operations!
