This is a closed note, closed-book exam. You are allowed **one back-and-front page of notes, and the reference sheet posted on the course website.** You may not use any laptops, cell phones, or internet devices of any sort, unless you are taking the exam on a laptop, which must only be used for the exam. You will be graded on functionality—but good style helps graders understand what you were attempting. You do not need to #include any libraries and you do not need to forward declare any functions. You have 2 hours. We hope this exam is an exciting journey.

Last Name: _______________________
First Name: _______________________
Sunet ID (eg jdoe): _______________________
Section Leader: _______________________

I accept the letter and spirit of the honor code. I’ve neither given nor received aid on this exam. I pledge to write more neatly than I ever have in my entire life.

**Question 1: Algorithm Analysis and Big O (10 Points)**

Give a tight bound of the nearest runtime complexity class for each of the following code fragments in Big-Oh notation, in terms of variable $N$. (Write the growth rate as $N$ grows.) Write a simple expression that gives only a power of $N$, such as $O(N^2)$ or $O(\log N)$, not an exact calculation like $O(2N^3 + 4N + 14)$. Write your answer in the blanks on the right side.

<td>a) int sum = 0; for (int i = 0; i &lt; N; i++) { sum++; } for (int i = 100*N; i &gt;= 0; i--) { sum++; } cout &lt;&lt; sum &lt;&lt; endl;</td>
<td>$O(___________)$</td>
</tr>
<tr>
<td>b) int sum = 0; for (int i = 1; i &lt; N - 2; i++) { for (int j = 0; j &lt; N * 3; j += 2) { for (int k = 0; k &lt; 1000; k++) { sum++; } } } cout &lt;&lt; sum &lt;&lt; endl;</td>
<td>$O(___________)$</td>
</tr>
<tr>
<td>c) Vector&lt;int&gt; v; for (int i = 0; i &lt; N; i++) { v.add(i); } while (!v.isEmpty()) { v.remove(0); } cout &lt;&lt; &quot;done!&quot; &lt;&lt; endl;</td>
<td>$O(___________)$</td>
</tr>
<tr>
<td>d) Set&lt;int&gt; set; for (int i = 0; i &lt; N/2; i++) { set.add(i); } Stack&lt;int&gt; stack; for (int i = 0; i &lt; N/2; i++) { set.remove(i); stack.push(i); } cout &lt;&lt; &quot;done!&quot; &lt;&lt; endl;</td>
<td>$O(___________)$</td>
</tr>
<tr>
<td>e) Queue&lt;int&gt; queue; for (int i = 1; i &lt;= N; i++) { queue.enqueue(i * i); } HashMap&lt;int, int&gt; map; while (!queue.isEmpty()) { int k = queue.dequeue(); map.put(k, N * N); } cout &lt;&lt; &quot;done!&quot; &lt;&lt; endl;</td>
<td>$O(___________)$</td>
</tr>
</tbody>
</table>
Question 2: Stacks and / or Queues (12 Points)

For this problem, you will be given a sequence consisting of the letters ‘I’ and ‘D’ where ‘I’ denotes an increasing sequence and ‘D’ denotes a decreasing sequence of numbers. Here are some examples:

<table>
<thead>
<tr>
<th>Sequence</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>IIDDIDID</td>
<td>125437698</td>
</tr>
<tr>
<td>IDIDII</td>
<td>1325467</td>
</tr>
<tr>
<td>DDDD</td>
<td>54321</td>
</tr>
<tr>
<td>IIII</td>
<td>12345</td>
</tr>
<tr>
<td>I</td>
<td>12</td>
</tr>
<tr>
<td>D</td>
<td>21</td>
</tr>
</tbody>
</table>

Note that a sequence of $n$ characters produces a number with $n+1$ digits, because the ‘I’ or ‘D’ represent the nature of the sequence from one number to the next.

Write the following function, which takes a string sequence and returns a string that represents the minimum number without repeating any digits:

```cpp
string decode(string seq);
```

Notes:

1. You must use a stack and / or a queue in your solution in a meaningful way.
2. For full credit, your solution should run in worst-case $O(n)$ time (you can still receive most of the points for a non-$O(n)$ solution).
3. You should only use the digits 1-9 (not 0).
4. You may use the Stanford library function `string integerToString(int i)` if you need to.
5. You do not need to #include any Stanford or Standard libraries (e.g., if you use a stack or a queue, we will assume the appropriate libraries are included).
6. The minimum length of the input sequence will be one character, and the maximum length of the input sequence string will be eight characters.
Please put your answer to question 2 here:

```cpp
string decode(string seq) {
```
**Question 3: Recursion Tracing (10 points)**

For each of the calls to the following recursive function below, indicate what output is produced:

```cpp
void recursionMystery(int n) {
    if (n <= 1) {
        cout << "*";
    } else if (n == 2) {
        recursionMystery(n - 1);
        cout << "*";
    } else {
        cout << "("
        recursionMystery(n - 2);
        cout << ")";
    }
}
```

<table>
<thead>
<tr>
<th>Call</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>a) recursionMystery(2);</td>
<td></td>
</tr>
<tr>
<td>b) recursionMystery(3);</td>
<td></td>
</tr>
<tr>
<td>c) recursionMystery(4);</td>
<td></td>
</tr>
<tr>
<td>d) recursionMystery(6);</td>
<td></td>
</tr>
<tr>
<td>e) recursionMystery(9);</td>
<td></td>
</tr>
</tbody>
</table>
Question 4: ADTs (12 points)

Consider the following function:

```cpp
void collectionMystery(const Map<string, string>& m) {
    Set<string> s;
    for (string key : m) {
        if (m[key] != key) {
            s.add(m[key]);
        } else {
            s.remove(m[key]);
        }
    }
    cout << s << endl;
}
```

Note: remember that a map stores keys in order (e.g., “cat” is stored before “dog”).

Write the output produced by the function when passed each of the following maps:

<table>
<thead>
<tr>
<th>Map</th>
<th>Output</th>
</tr>
</thead>
</table>
| a) 
{"cast":"plaster", "house":"brick", "sheep":"wool", "wool":"wool"} |        |
| b) 
{"ball":"blue", "corn":"yellow", "emerald":"green", "grass":"green", "winkie":"yellow"} |        |
| c) 
{"apple":"peach", "corn":"apple", "peach":"peach", "pie":"fruit", "potato":"peach"} |        |
| d) 
{"cat":"cat", "corgi":"dog", "emu":"animal", "lab":"lair", "lair":"lair", "nyan":"cat"} |        |
Question 5: The Traveling Salesman Problem (15 points)

There is a famous problem in computer science and mathematics called the Traveling Salesman Problem. It is stated as follows:

“A salesman must visit \( n \) cities in a given area. Given the list of cities and the distances between them, what is the shortest possible route that visits each city exactly once and returns to the original city?”

This problem is in the computational category called \( \textit{NP-Complete} \), which means that there is no known way to find an efficient solution. That is the bad news. The good news is that we have a method for finding all solutions to the problem (however inefficient), and choosing the correct one: recursive backtracking!

Assume all cities are numbered from 0 to \( n-1 \), and you have a \texttt{Grid<double> distance} where \( \text{distance}[r][c] \) is the distance between city \( r \) and city \( c \). Here is an example of a 4x4 grid with cities 0-3 (indexes in bold, distances in plain text):

<table>
<thead>
<tr>
<th></th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>10</td>
<td>15</td>
<td>20</td>
</tr>
<tr>
<td>1</td>
<td>10</td>
<td>0</td>
<td>35</td>
<td>25</td>
</tr>
<tr>
<td>2</td>
<td>15</td>
<td>35</td>
<td>0</td>
<td>30</td>
</tr>
<tr>
<td>3</td>
<td>20</td>
<td>25</td>
<td>30</td>
<td>0</td>
</tr>
</tbody>
</table>

The solution to the Traveling Salesman Problem starting and ending at city 0 is:

\[ 0 \rightarrow 1 \rightarrow 3 \rightarrow 2 \rightarrow 0 \]

for a total trip distance of \( 10 + 25 + 30 + 15 = 80 \)

Write the following function, which returns a \texttt{Vector<int> bestRoute} of the \texttt{best possible route} between the cities, which has the original city as its first element and its last element, for a complete path:

\texttt{Vector<int> bestRoute(Grid<double> &distance, int startCity);}

You are allowed to create any helper functions you need, and your solution should recursively check all possible paths between all cities, starting from the first city.

Notes:

1. You can assume you have access to the following function, which calculates the total distance of a \texttt{Vector<int> route}:

\[
\text{double totalRouteDistance(Grid<double> &distance, Vector<int> &route);}\
\]

2. You may use the constant \texttt{DBL_MAX} (the largest possible double) to indicate an infinite distance.
Please put your answer to question 5 here:

```
Vector<int> bestRoute(Grid<double> &distance, int startCity) {
```
Extra space for question 5:
