Where to Go from Here
Announcements

• Assignment 7 is due right now.
  • Congratulations! You’ve completed the last assignment of the quarter!

• Final exam is this upcoming Monday from 8:30AM – 11:30AM. Locations are divvied up by last (family) name:
  • A – O: Go to Cubberley Auditorium
  • P – Z: Go to Cemex Auditorium

• Exam is closed-book and limited-note. You get one double-sided sheet of 8.5” × 11” notes with you.

• Need a laptop? No worries! Let us know and we can prep one for you.
Taking Stock: Where Are We?
Goals for this Course

• Learn how to model and solve complex problems with computers.

• To that end:
  • Explore common abstractions for representing problems.
  • Harness recursion and understand how to think about problems recursively.
  • Quantitatively analyze different approaches for solving problems.
Assignment 1: Strings, Streams, and Recursion
Guesses left: 2
Guessed letters: e t o a i n s h r d l u
Word: -u---
Possible words: 21
Guess: m
Sorry, there are no m's.

Guesses left: 1
Guessed letters: e t o a i n s h r d l u m
Word: -u---
Possible words: 13
Guess: p
Sorry, there are no p's.

Game over! You lost.
The hidden word was 'bubby.'

Play again?

Assignment 2: Container Types
Assignment 3: Memoization, Recursive Optimization
Assignment 4: Recursive Backtracking
This tool displays the strongest recent earthquakes reported by the US Geological Survey. You can use the controls on the side of the window to select the time interval you're interested in. This visualizer will show the 5 strongest earthquakes within that interval. Remember that the earthquake magnitude scale is logarithmic. An earthquake that is one magnitude in strength higher than another releases around 32 times as much energy.

- Magnitude 7.5 115km ESE of Palora, Ecuador at 02:17:22 AM on Feb 22, 2019
- Magnitude 7 27km NNE of Azangaro, Peru at 12:50:41 AM on Mar 01, 2019
- Magnitude 6.4 116km SE of L'Esperance Rock, New Zealand at 07:46:14 AM on Mar 06, 2019
- Magnitude 6.4 49km NW of Namatanai, Papua New Guinea at 06:35:55 AM on Feb 17, 2019
- Magnitude 6.2 Northern Mid-Atlantic Ridge at 11:57:05 AM on Feb 14, 2019

Assignment 5: Big-O, Sorting, Dynamic Arrays
Intersectionality

The term intersectionality was coined by Kimberlé Crenshaw in 1989 to describe the interlocking systems of power and oppression that impact individuals in society. Intersectionality refers to the concept that various forms of social stratification, such as race, class, gender, sexual orientation, age, religion, creed, disability, and occupation, do not exist separately from each other but are woven together. While the theory began as an exploration of the oppression of women of color within society, today the analysis is potentially applied to all social categories, including social identities usually seen as dominant when considered independently.

Historical background

The concept of intersectionality is intended to illuminate dynamics that have often been overlooked by feminist movements and

Assignment 6: Linked Lists, Tries, Binary Search Trees
Assignment 7: Graph Algorithms
What We’ve Covered

Strings
Streams
Recursive Problem-Solving
Stacks
Queues
Vectors
Maps
Sets
Lexicons
What We’ve Covered

Recursive Graphics
Recursive Enumeration
Recursive Optimization
Recursive Backtracking
Big-O Notation
Insertion Sort
Mergesort
What We’ve Covered

Designing Abstractions
Constructors
Destructors
Dynamic Arrays
Linked Lists
Binary Search Trees
Tries
Hash Tables
What We’ve Covered

Graph Representations
Breadth-First Search
Depth-First Search
DAGs
Topological Sorting
Minimum Spanning Trees
Kruskal’s Algorithm
But also...
What We’ve Covered

Chaotic Systems
Language Processing
Physical Simulation
Word Games
What We’ve Covered

Fractals
Resource Optimization
Operations Research
Data Exploration
Computer science is more than just programming.
These skills will make you better at whatever you choose to do.
So what comes next?
Courses to Take
The CS Core

CS106B Programming Abstractions

CS107 Computer Organization and Systems

CS110 Principles of Computer Systems

CS103 Mathematical Foundations of Computing

CS109 Intro to Probability for Computer Scientists

CS161 Design and Analysis of Algorithms

The CS Core
The CS Core

- CS106B: Programming Abstractions
- CS107: Computer Organization and Systems
- CS110: Principles of Computer Systems
- CS103: Mathematical Foundations of Computing
- CS109: Intro to Probability for Computer Scientists
- CS161: Design and Analysis of Algorithms
What are the fundamental limits of computing power?

How can we be certain about this?
Some infinities are bigger than other infinities, and this has practical consequences.

Tropes from Ancient Greek mythology can be made mathematically rigorous to prove limits on computing power.

Abstract models of computation have applications in network drivers, user interfaces, compiler design, and text processing.
What is the internal organization of memory in a computer?

How do we bridge the dichotomy between high-level problem-solving and voltages in wires?

And why is this important to know?
The nature of memory layout explains why computer security is so hard to get right.

Computers are physical devices whose inner workings are visible even in higher-level languages.

Compilers can sometimes rewrite recursive functions iteratively, giving you the best of both worlds.
What CS107 Isn't

• CS107 is **not** a litmus test for whether you can be a computer scientist.
  • You can be a *great* computer scientist without enjoying low-level systems programming.

• CS107 is **not** indicative of what programming is “really like.”
  • CS107 does a lot of low-level programming. You don't have to do low-level programming to be a good computer scientist.

• CS107 is **not** soul-crushingly impossibly hard.
  • It's tricky. It does not eat kittens.

• *Don't be afraid to try CS107!*
Other CS Courses
CS193
Programming Language Particulars

- Many offerings throughout the year, focused on specific technologies:
  - CS193A: Android Programming
  - CS193C: Client-Side Web Technologies
  - CS193I: iOS Programming
  - CS193P: iPhone and iPad Programming
  - CS193Q: Accelerated Intro to Python
- Great for learning particular technologies.
Explore what C++ programming looks like outside of CS106B.

Get exposure to the standard libraries and some really, really cool techniques beyond what we saw here.

Excellent next step if you’d like to work in C++ going forward.
CS106E
Practical Exploration of Computing

• Broad survey of computing topics, including
  • how the internet works,
  • computer security,
  • how operating systems work,
  • bits and bytes, and
  • web programming.

• Great course if you’re interested in working in the software industry in a non-technical capacity.
CS147
Intro to Human-Computer Interaction

- How do you design software to be usable?
- What are the elements of a good design?
- How do you prototype and test out systems?
- Prerequisite: CS106B! ✓
The CS Major
Thinking about CS?

• Good reasons to think about doing CS:
  • I like the courses and what I’m doing in them.
  • I like the people I’m working with.
  • I like the impact of what I’m doing.
  • I like the community.

• Bad reasons to think about not doing CS:
  • I’m good at this, but other people are even better.
  • The material is fun, but there’s nothing philosophically deep about it.
  • I heard you have to pick a track and I don’t know what I want to do yet.
  • What if 20 years later I’m just working in a cubicle all day and it’s not fun and I have an Existential Crisis?
The CS Major

- A common timetable:
  - Aim to complete *most* of the core by the end of your sophomore year (probably CS106B, CS103, CS107, CS109, and one of CS110 and CS161).
  - Explore different tracks in your junior year and see which one you like the most.
  - Spend your senior year completing it.
- It’s okay if you start late!
  - The latest time you can *comfortably* start a CS major would be to take CS106A in winter quarter of sophomore year.
  - And the coterm is always an option!
The CS Coterm
The CS Coterm

• The CS coterm is open to students of all majors, not just computer science.
  • *This is intentional*. We want the doors to be open to all comers.

• Thinking about applying?
  • *Take enough CS classes to establish a track record.*
  • *Maintain a solid CS GPA.* Aim high!

• TA and RA positions are available to offset the cost.
  • Some of my best TAs did their undergrad in comparative literature, anthropology, and, physics.
The CS Minor
Outside Stanford
Learning More

• Some cool directions to explore:
  
  • *Specific technologies*. You already know how to program. You just need to learn new technologies, frameworks, etc.
  
  • *Algorithms*. Learn more about what problems we know how to solve.
  
  • *Software engineering*. Crafting big software systems is an art.
  
  • *Machine learning*. If no new ML discoveries were made in the next ten years, we’d still see huge improvements.
How to Explore Them

• MOOCs are a great way to get an introduction to more conceptual topics.
  • Andrew Ng’s machine learning course, Fei Fei Li’s computer vision course, Tim Roughgarden’s algorithms course, and Jennifer Widom’s databases courses are legendary.

• Learning by doing is the best way to pick up new languages and frameworks.
  • Find a good tutorial (ask around), plan to make a bunch of mistakes, and have fun!

• Know where to ask for help.
  • Stack Overflow is an excellent resource.

My Email Address

htiek@cs.stanford.edu
You now have a wide array of tools you can use to solve a huge number of problems.

You have the skills to compare and contrast those solutions.

You have expressive mental models for teasing apart those problems.
My Questions to You:

What problems will you choose to solve?
Why do those problems matter to you?
And how are you going to solve them?
