RE-Net: A Character-Based Model Replicating R-Net

Arvind Subramanian & Aditya Isvara

Introduction
Contextual question answering is a problem that has garnered a lot of attention in the past few years. The SQuAD Challenge is a question answering task that incentivizes the development of a model that can extract salient answers to a question from a large block of context text, which would be valuable in streamlined information extraction. We propose an improvement on a baseline BiDAF model by replicating R-Net, a model that adds character-level embeddings, self-matching attention and gated attention network. Our contributions to this paper will be the validation of R-Net’s performance on the SQuAD2.0 dataset.

Models

- Convolutional neural network to generate character embeddings of words
- Combination of character embeddings and word embeddings is passed into highway network
- Contains BiDAF Attention Layer

Character Embedding Model

- Question-Context Matching using gated attention-based RNN to create question-based passage representation
- Self-matching attention creates more context in passage representation
- Pointer network output layer

R-Net

Dataset

SQuAD2.0

The first recorded travels by Europeans to China and back date from this time. The most famous traveler of the period was the Venetian Marco Polo, whose account of his trip to “Cambicuc,” the capital of the Great Khan, and of the wealth around the people of Europe. The account of his travels, II millione (or, The Million, known in English as the Travels of Marco Polo), appeared about the year 1299. Some argue over the accuracy of Marco Polo’s accounts due to the lack of mentioning the Great Wall of China, tea houses, which would have been a prominent sight since Europeans had yet to adopt a tea culture, as well as the practice of foot binding by the women in capital of the Great Khan. Some suggest that Marco Polo acquired much of his knowledge through contact with Persian traders since many of the places he named were in Persia.

How did some suspect that Polo learned about China instead of by actually visiting it?

Answer: through contact with Persian traders

- Question-answering dataset
- Difference from SQuAD1.1: Indicates if no answer is available in context paragraph

Experimental Details

- Learning rate of 1
- Batch size of 16 (for memory purposes)
- Trained on 20 epochs

Moreover, the size of the hidden layer used was 50 and we used the 300-dimensional GloVe vectors, as used by the baseline model.

- Improvement over baseline model
- Similar scores between RE-Net and Char-Embedding BiDAF Model

Discussion

Improvements from Baseline

- Higher EM/F1 score
- Use of character embeddings provides more information per word than use of only word embeddings

Example Inaccuracy

Model’s Answer: in the possession of already wealthy individuals or entities
Correct Answer: those who already hold wealth

- Model performs poorly on this example.
- Contains irrelevant text like “in the possession”
- Phrasing of the question suggests an answer that is the object of some action.
- The model uses this assumption and outputs the answer starting with “in the possession…”

Shortcomings

- Used hidden size of 50 rather than 75
- Ran for 20 epochs rather than 30 for time purposes.
- Learning rate of 1 rather than 0.5 reduced accuracy.
- General hyperparameter tuning to improve runtime efficiency reduced accuracy.
