

# Peer Production

CS 278 | Stanford University | Michael Bernstein

# Announcements

Project **milestone** due Thursday by 4pm

**Exam question bank**, based on your votes, is coming out soon

**Exam is one week from today**: 3/4 questions in the question bank, 1/4 staff-written questions that cover through this week

# Last time

Crowdsourcing: an open call to a large group of people who self-select to participate

Crowds can be surprisingly intelligent, if opinions are levied with some expertise and without communication, then aggregated intelligently.

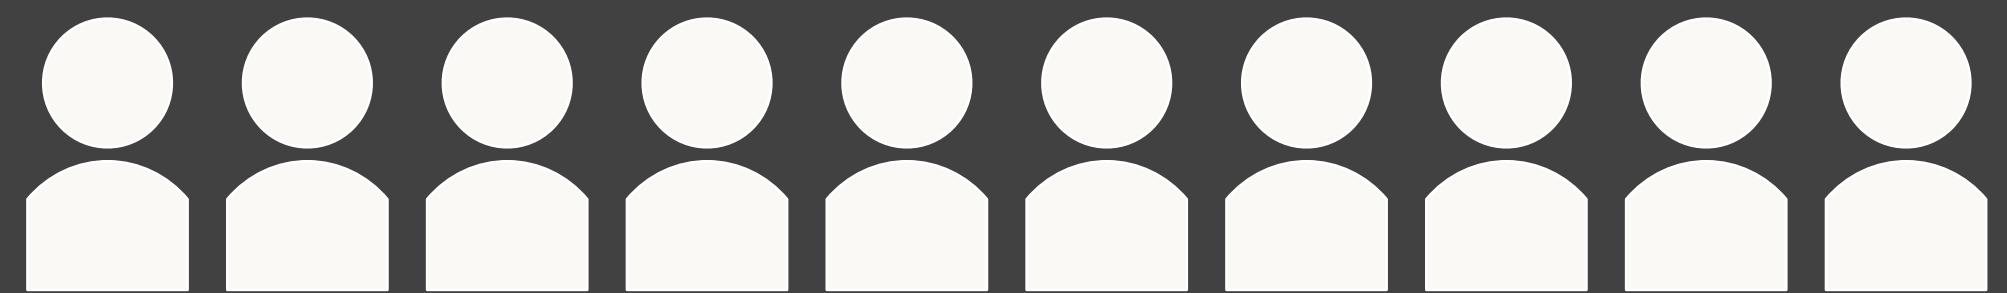

Design differently for intrinsically and extrinsically motivated crowds

Vandalism—much like other anti-social behavior—is rare, but can happen

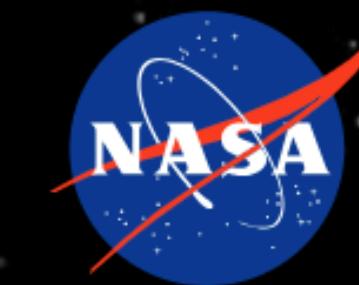

# Last time

Parallel, independent contributions

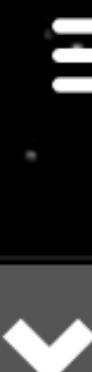

But, this only works if the goal can be subdivided into modular components with few or no interdependencies.

Think filling out rows of a spreadsheet or taking argmax

Search

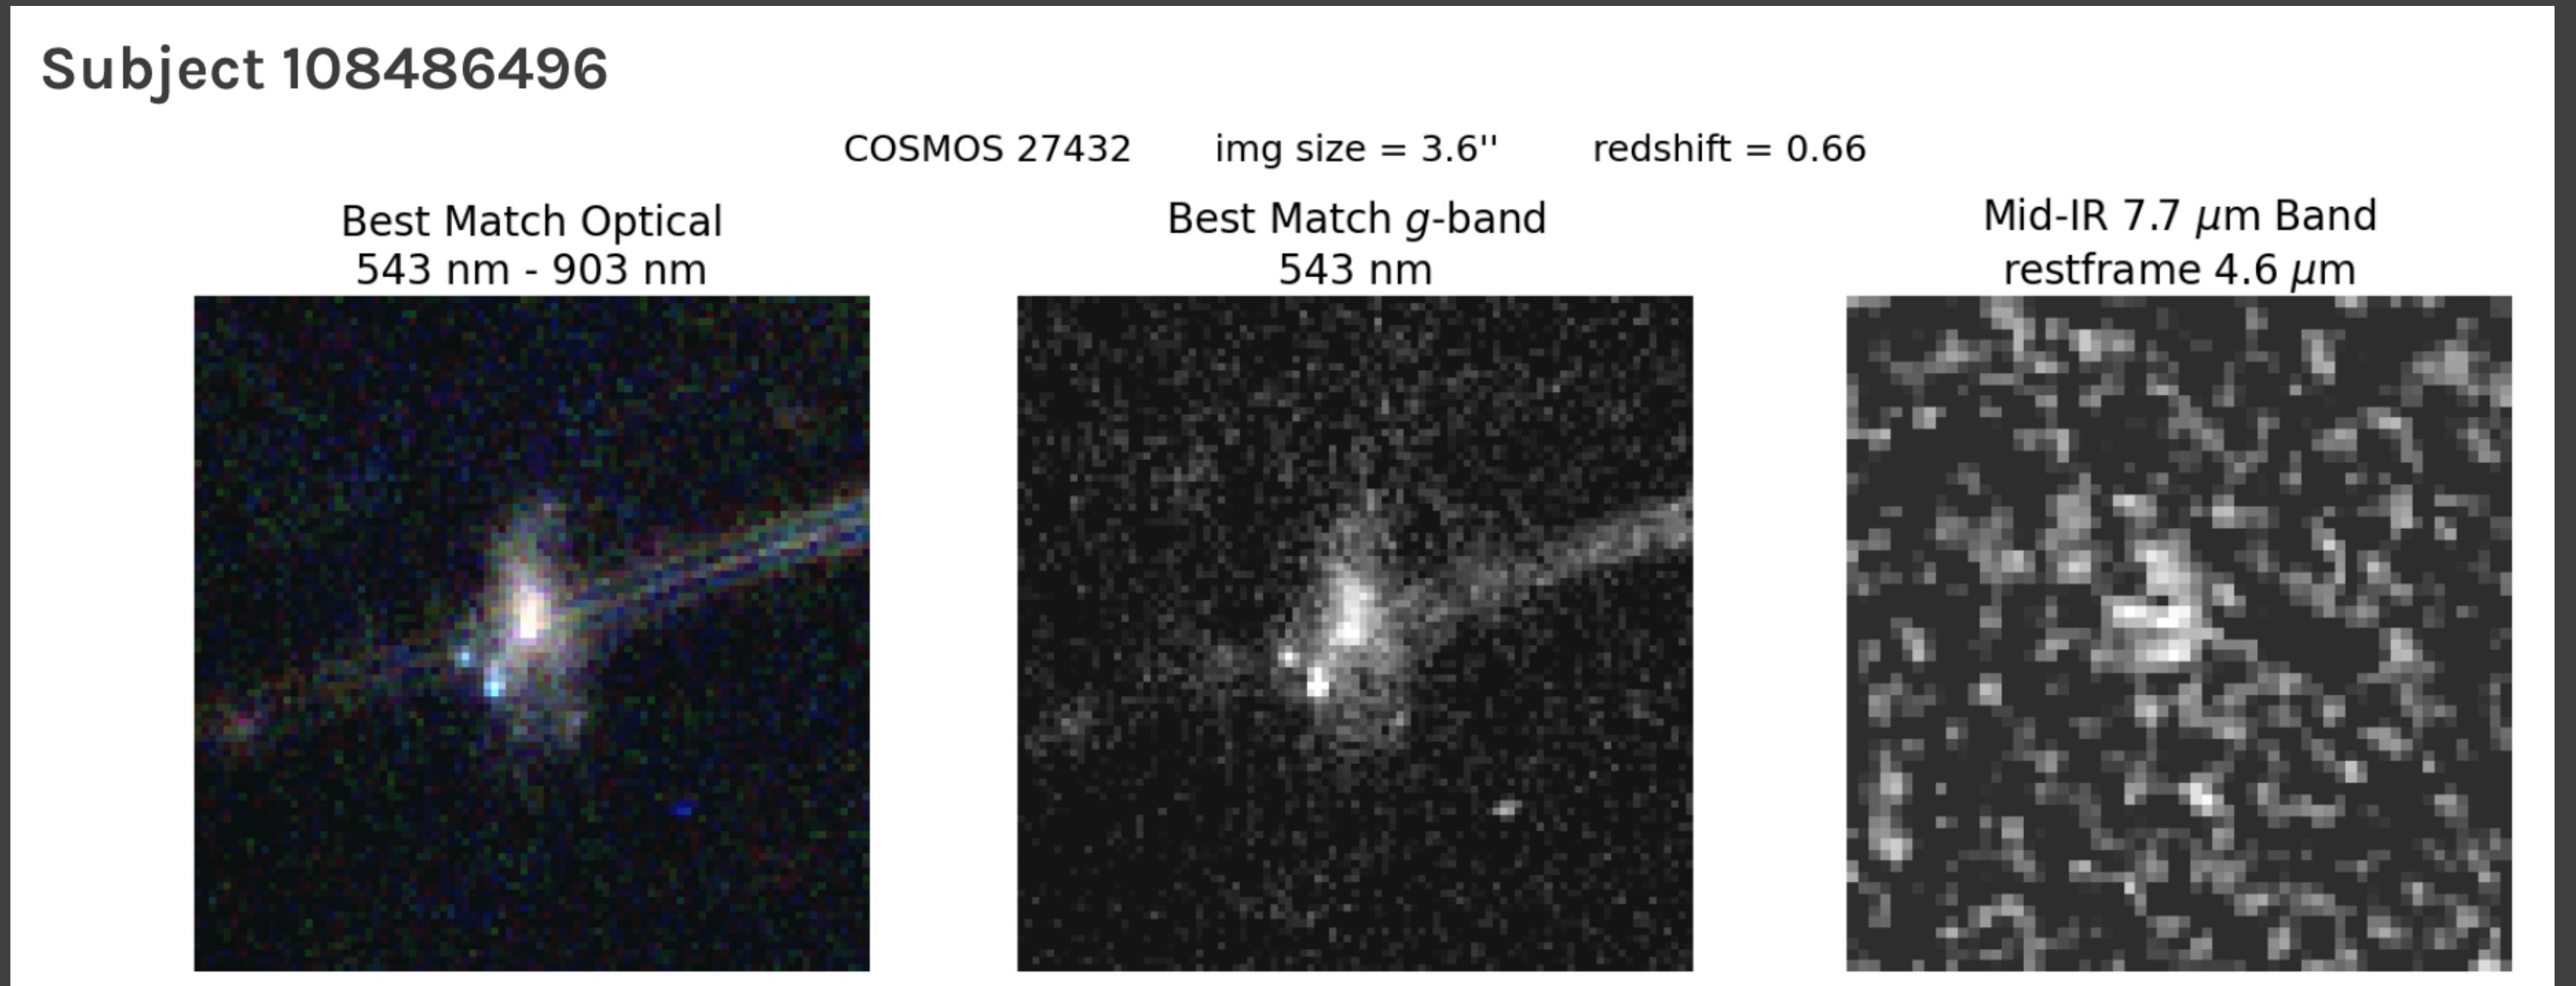

NASA Solve

## Welcome to NASA Solve!

Interested in helping NASA solve tough problems? You are in the right place! This one-stop-shop website is where you'll find opportunities to participate in challenges, prize competitions, and citizen science activities that develop solutions for problems related to NASA's mission. So, jump in and become a NASA SOLVE-r!

## “Crowdsourcing” example submitted by Irene A. Lin

Galaxy Zoo is an online crowdsourcing project where anyone can help classify galaxies. Within 24 hours of launch, volunteers were submitting 70,000 classifications per hour. The platform has led to major discoveries and some users have even become co-authors!

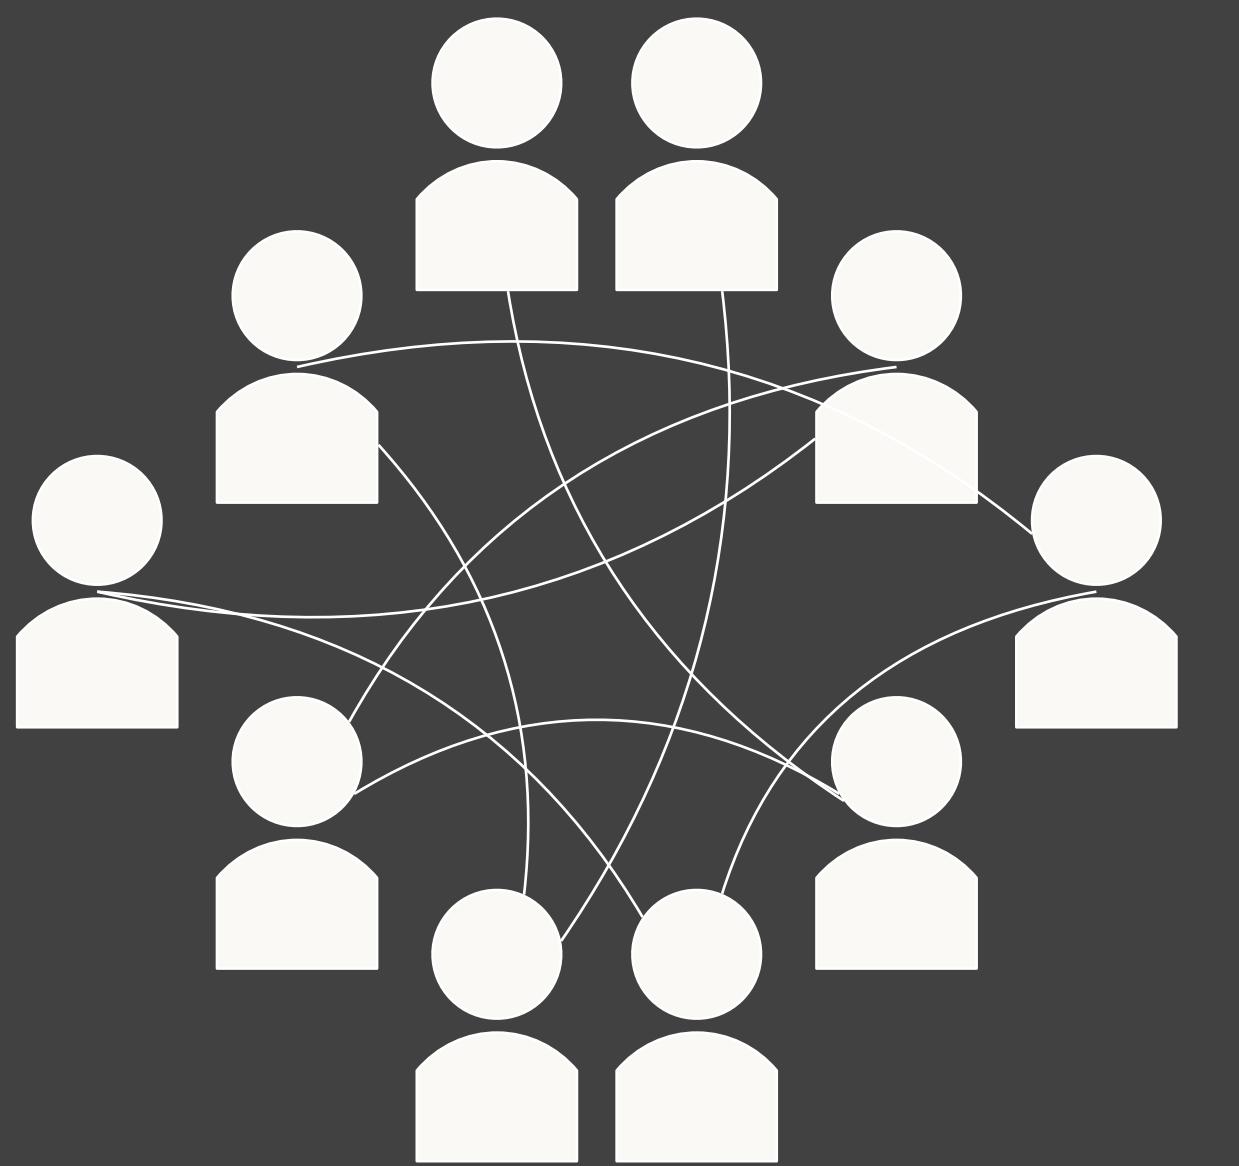

0.5% extra credit for examples relevant to recent or upcoming lectures. Submit on Ed under the “Extra Credit” category

Attendance

# Today

Interdependent, integrated contributions

Think invention, engineering,  
or design.

# How?

There are fundamental differences between parallel and interdependent contribution structures.

We can't just make a movie or build Linux with parallel contributions.

Johnny Cash Project: crowdsourced music video  
One frame per participant — beautiful, slightly anarchic

Star Wars Uncut: crowdsourced movie remake, 2hr long  
One scene per participant — style whiplash

# How?

If we can't do it with parallel contributions, how do we create complex outcomes with distributed online collaborations?

Topics:

Peer production

Workflows

Convergence and coordinated adaptation

The screenshot shows the GitHub homepage with a dark header. The header includes the GitHub logo, a 'Sign in' button, and a three-dot menu icon. Below the header, there's a 'Explore' button and a navigation bar with 'Topics', 'Trending' (which is underlined in blue), 'Collections', 'Events', and 'GitHub Sponsors'. The main content area is titled 'Trending' and features the text 'See what the GitHub community is most excited about today.'

# What is peer production?

Crowdsourcing: making an open call to a large set of individuals who self-select into tasks

Peer production introduces additional requirements, including...  
[Benkler 2002]

Decentralized conception: many control the direction and outcome, not a traditional bureaucracy

Results treated as a commons: the output is publicly available and generally non-rival (def: when I use it, it doesn't reduce your ability to use it)

No contracts: governance and work allocation isn't handled through signed contracts

# When does peer production work?

Benkler's argument [2002]: peer production outperforms traditional firms (e.g., for-profit companies) when (1) there exists strong intrinsic motivation and (2) work can be broken down into granular, easy-to-integrate tasks.

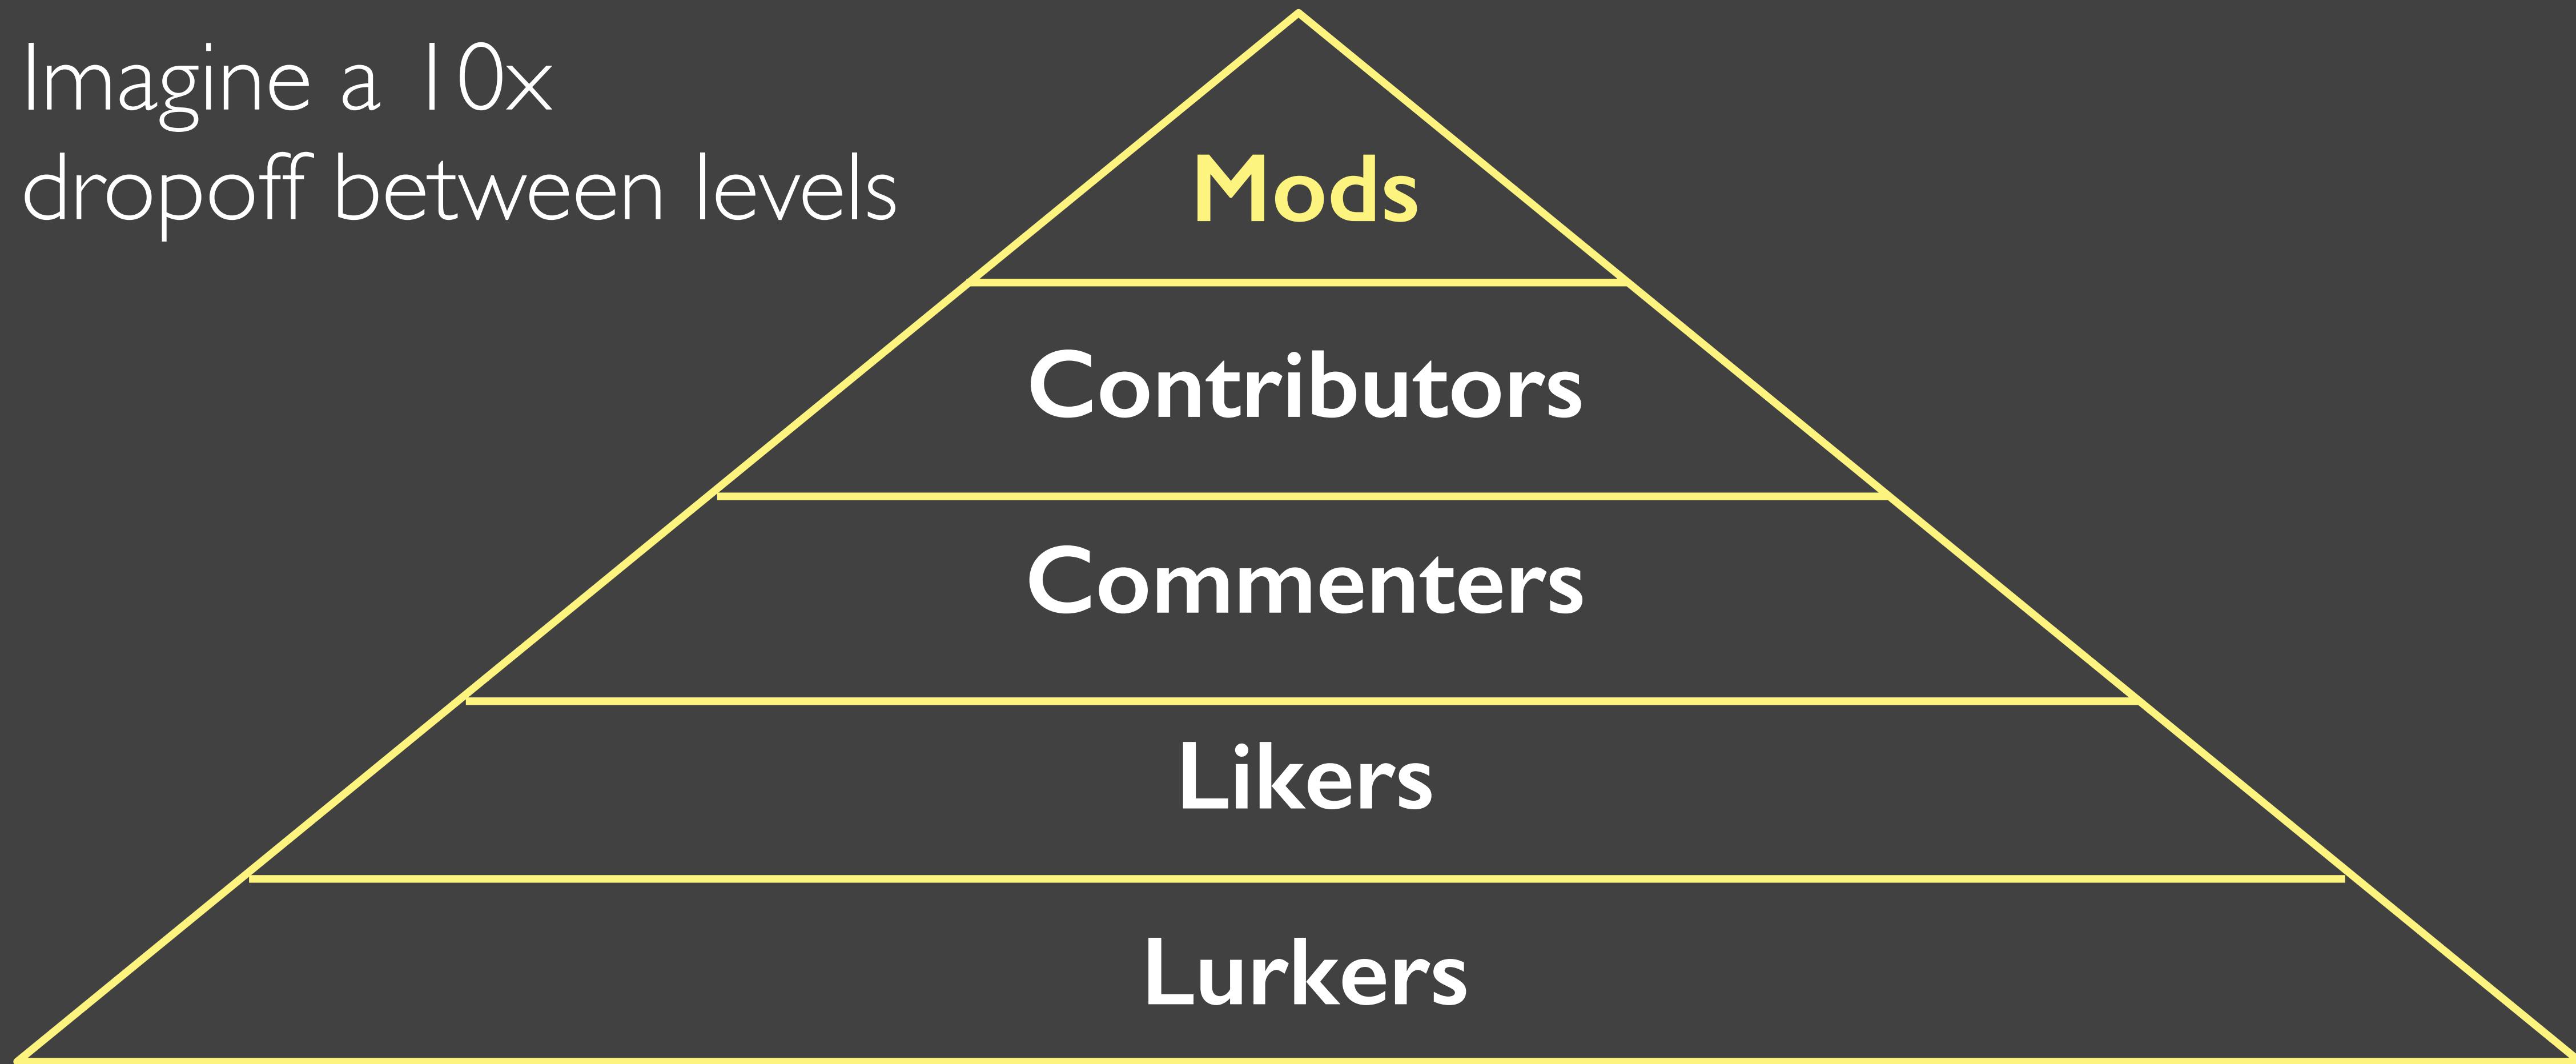

Linux server > Microsoft Windows server

# From before

Imagine a 10x  
dropoff between levels

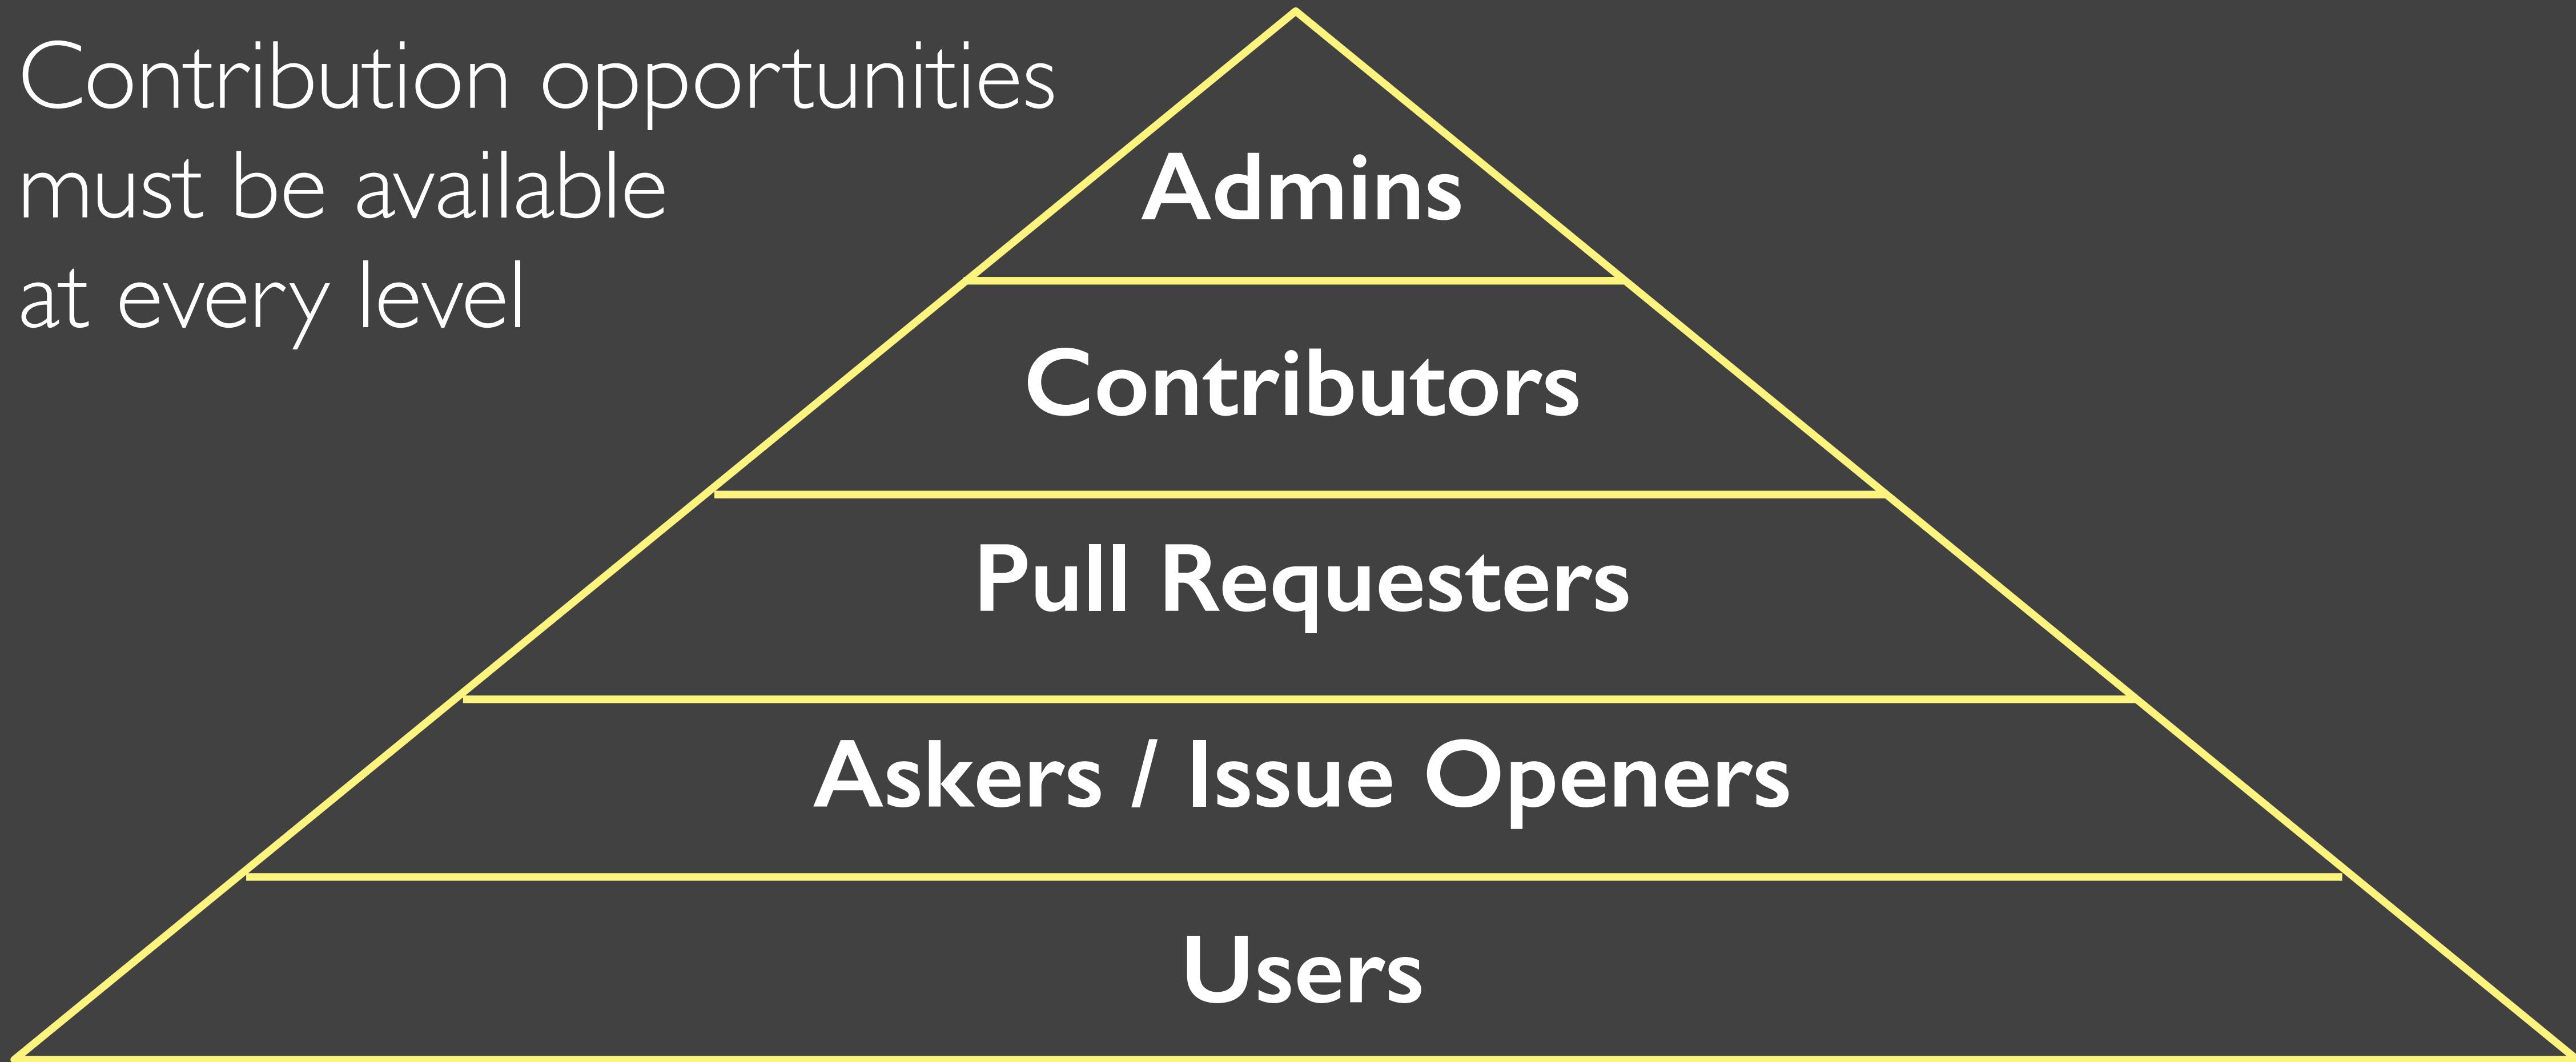

# Peer production: wiki

Contribution opportunities  
must be available  
at every level

# Peer production: OSS

Contribution opportunities  
must be available  
at every level

# Why do people do this?

The usefulness of the outcome to the contributor; hedonic pleasure of contributing (e.g., writing software); increased social capital, reputation, and status [von Hippel and von Krogh 2003, von Krogh et al. 2003, Benkler, Shaw and Hill 2015]

People self-select into communities that match their motivations [Glott et al. 2010, Ghosh and Prakash 2000; Belenzon and Schankerman 2008, Benkler, Shaw and Hill 2015]

Those extrinsically motivated by reputation and employment will contribute more to industry-sponsored projects

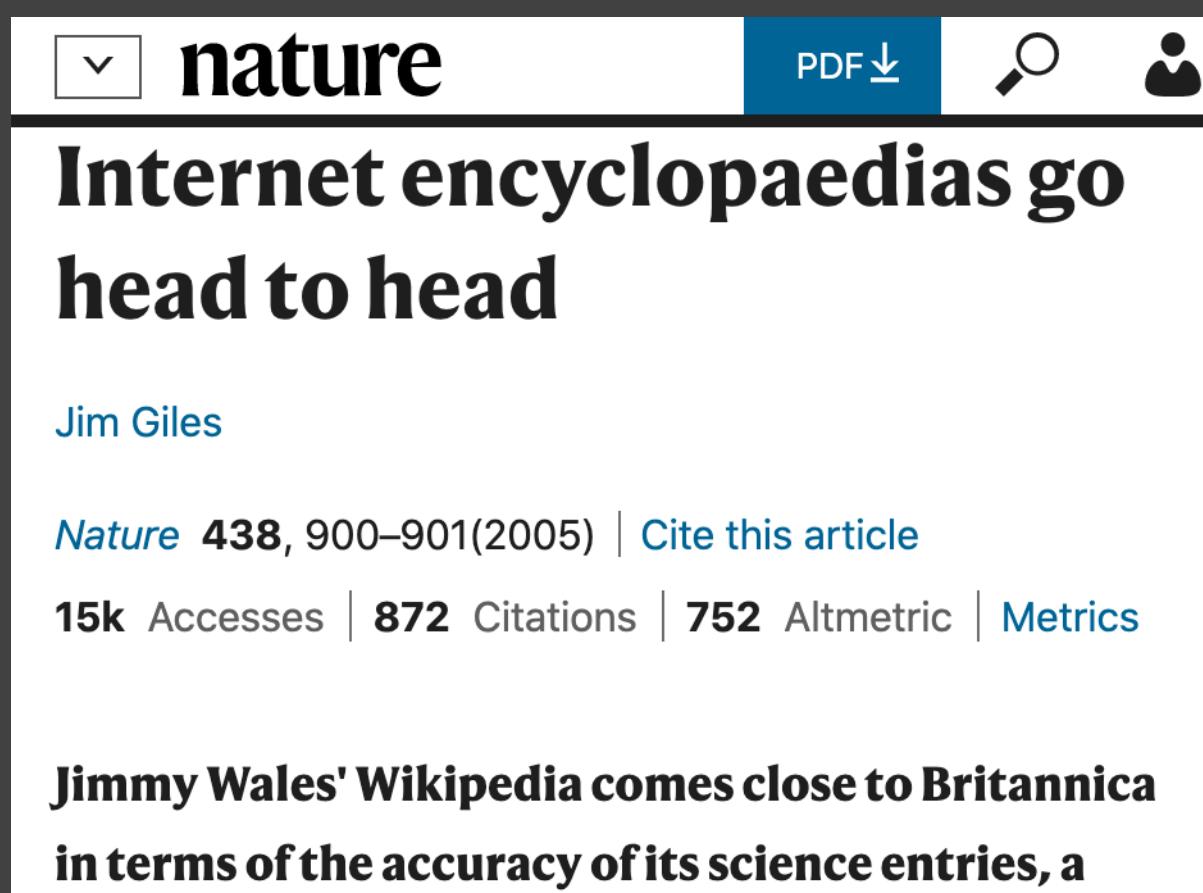

Those more intrinsically motivated will contribute more to free communities

# But does it really work?

## Pros

Linus's Law: "With enough eyes, all bugs are shallow" [Raymond 1999]

Wikipedia used to be disallowed as a citable source because it could not be trusted. But then:

## Cons

Many efforts do not achieve critical mass needed for quality [Ghost Town lecture]

Peer production appears better at creating functional artifacts (e.g., code) than creative artifacts (e.g., movies) [Benkler 2006]

No direct control of peoples' efforts: 1.5B monthly Wikipedia views go to articles that would be higher quality if editors optimally distributed their work to meet reader demand. [Warncke-Wang et al. 2015]

# And errors do occur...

The image is a screenshot of a news article from Quartz. At the top, it says "NPM ERR!" in blue. The main title is "How one programmer broke the internet by deleting a tiny piece of code". Below the title is the date "March 27, 2016". To the left of the date is a small circular profile picture of a man. Next to the picture, the text "By Keith Collins" and "Tech Reporter" is displayed. At the bottom of the screenshot, there is a code editor window showing a file named "leftpad.js". The code is as follows:

```
1 module.exports = leftpad;
2 function leftpad (str, len, ch) {
3   str = String(str);
4   var i = -1;
5   if (!ch && ch !== 0) ch = ' ';
6   len = len - str.length;
7   while (++i < len) {
8     str = ch + str;
9   }
10  return str;
11 }
```

node.js leftpad module incident

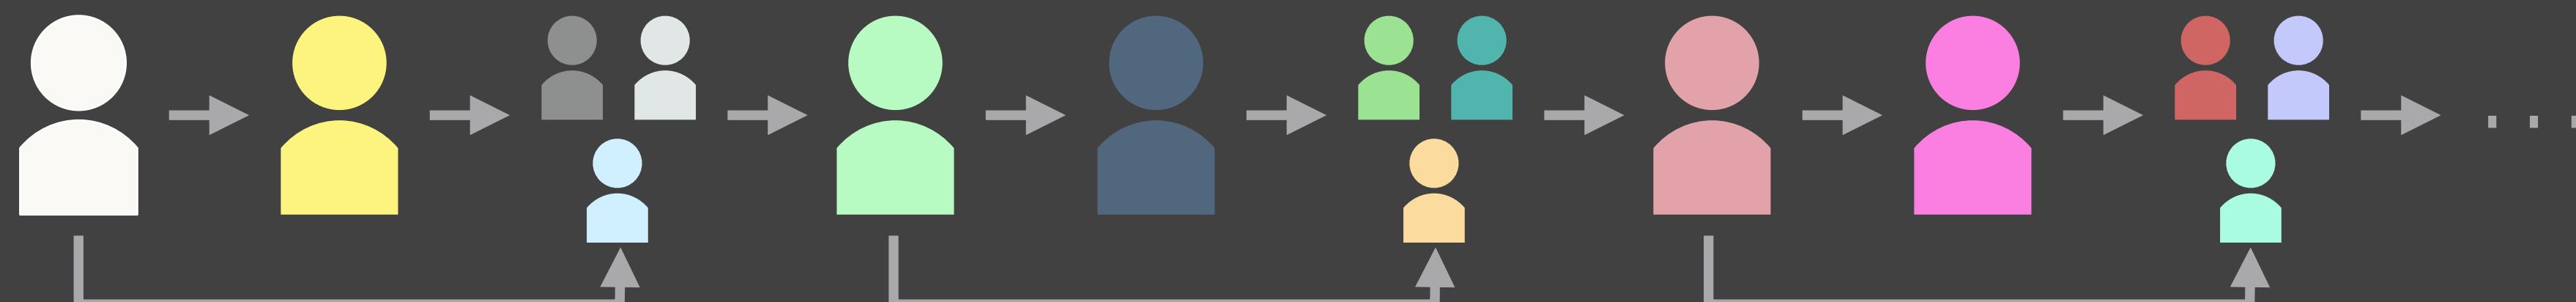

So given these tradeoffs, when would you opt for peer production over firm-based production, assuming you had moderate but not infinite funds?  
[2min]

# Workflows

# Iterative crowd algorithm

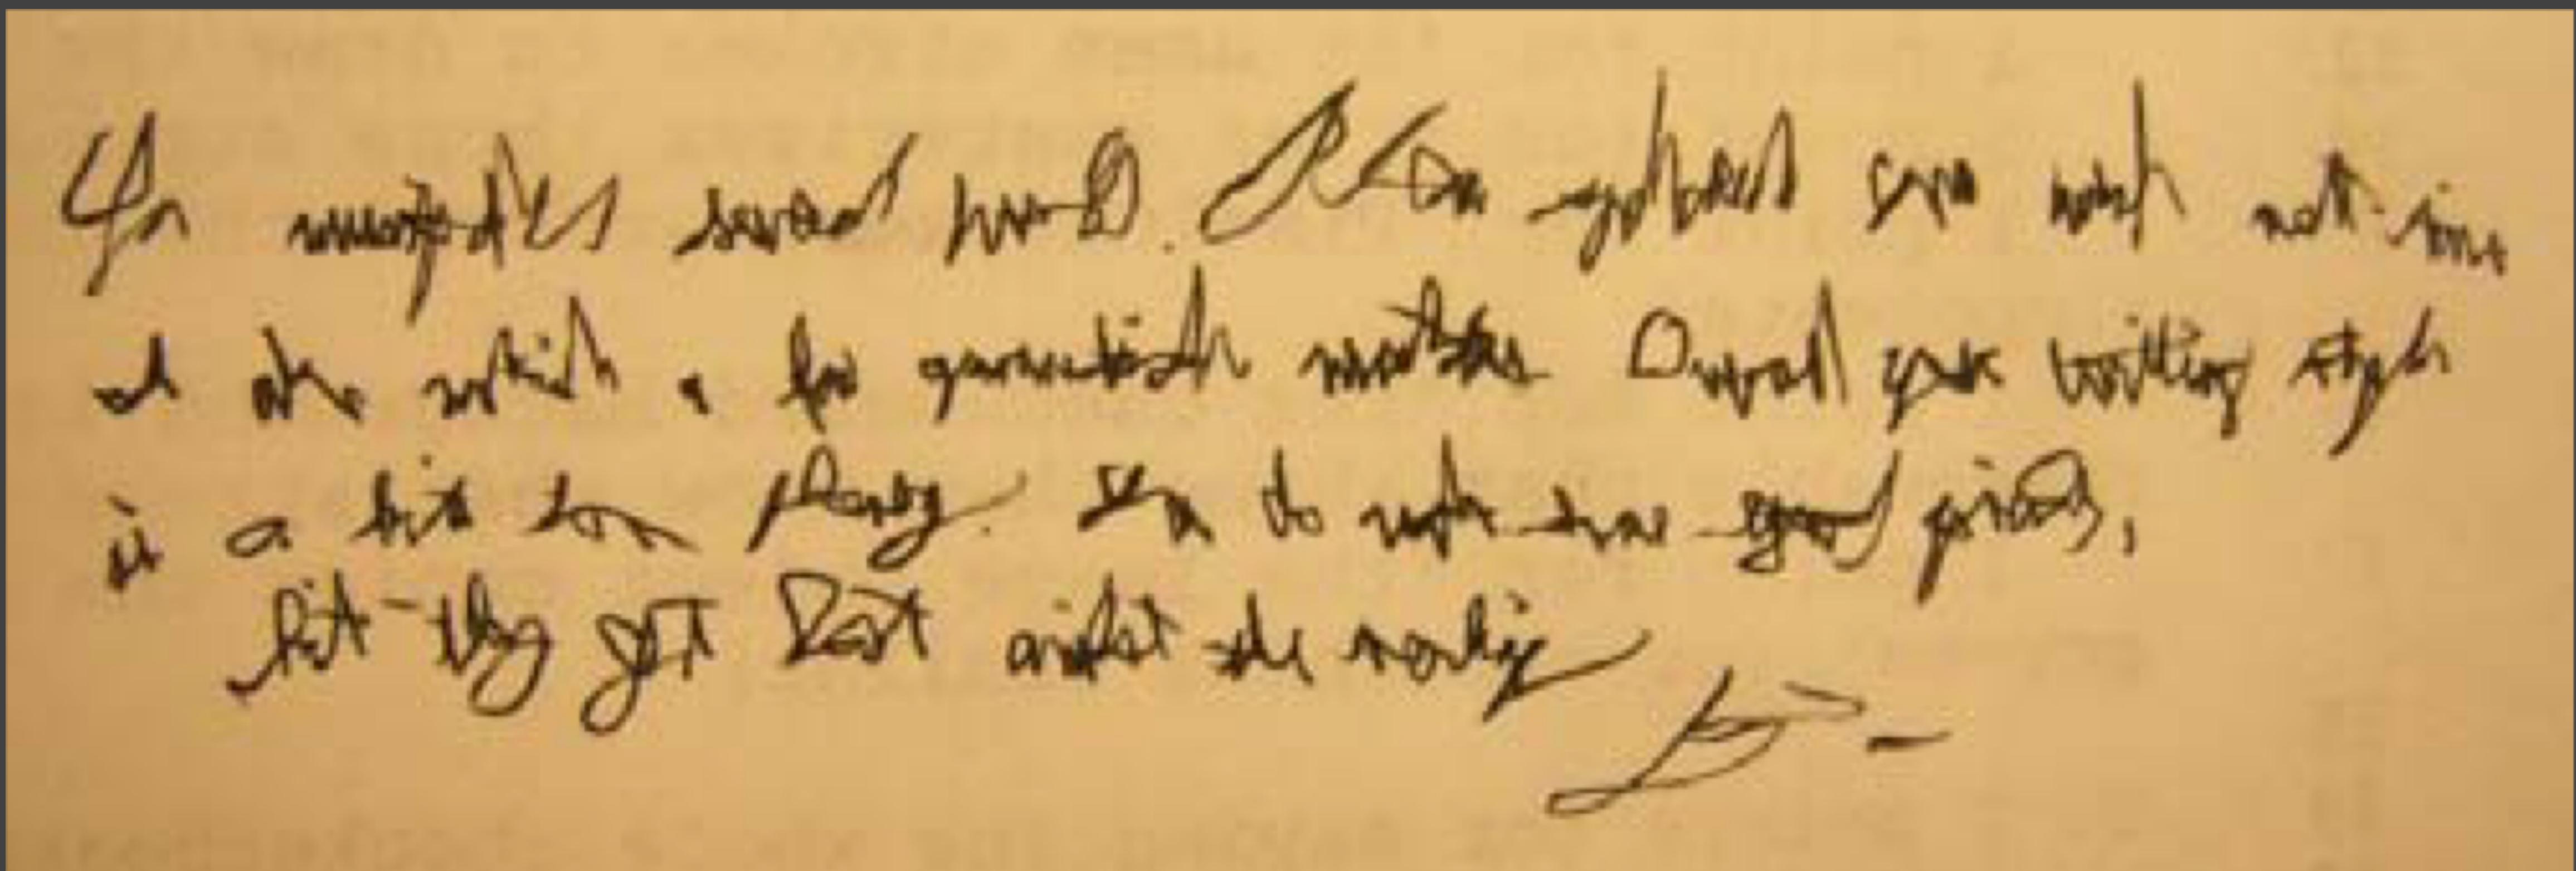

[Little et al. 2009]

In many of us want work. You should see with nothing  
in the which a few generations members. Overall you willing they  
is a bit too many. You do not have good friends,  
but they get lost amidst the work.

# Iterative crowd algorithm

[Little et al. 2009]

You (misspelled) (several) (words). Please spellcheck your work next time. I also notice a few grammatical mistakes. Overall your writing style is a bit too phoney. You do make some good (points), but they got lost amidst the (writing). (signature)

Automatic clustering generally helps separate different kinds of records that need to be edited differently, but it isn't perfect. Sometimes it creates more clusters than needed, because the differences in structure aren't important to the user's particular editing task. For example, if the user only needs to edit near the end of each line, then differences at the start of the line are largely irrelevant, and it isn't necessary to split based on those differences. Conversely, sometimes the clustering isn't fine enough, leaving heterogeneous clusters that must be edited one line at a time. One solution to this problem would be to let the user rearrange the clustering manually, perhaps using drag-and-drop to merge and split clusters. Clustering and selection generalization would also be improved by recognizing common text structure like URLs, filenames, email addresses, dates, times, etc.

Automatic clustering generally helps separate different kinds of records that need to be edited differently, but it isn't perfect. # Find-Fix-Verify

[Bernstein et al. 2010]

Find-Fix-Verify is a design pattern for open-ended tasks.

Find a problem

Fix the problem

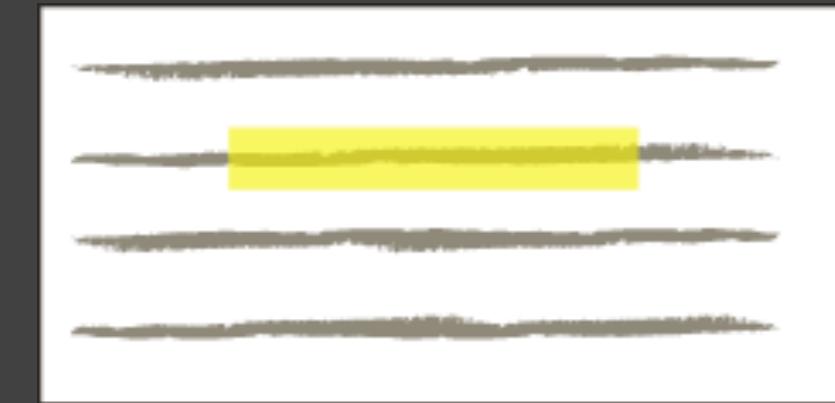

Verify each fix

- Soylent ~~is~~, a prototype...
- Soylent ~~is-a~~ prototypes...
- Soylent is a ~~prototype~~ test...

# Find

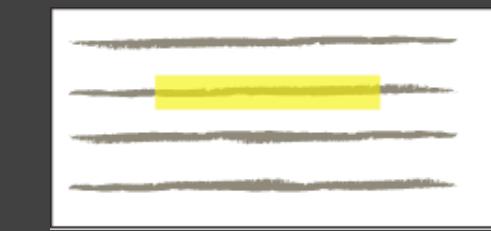

“Identify at least one area that can be shortened without changing the meaning of the paragraph.”

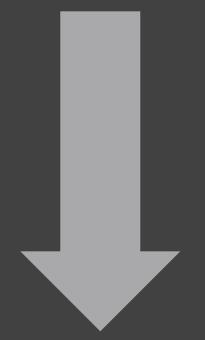

Independent agreement  
to identify patches

# Fix

“Edit the highlighted section to shorten its length without changing the meaning of the paragraph.”

Soylent, a prototype...

Randomize order of  
suggestions

# Verify

“Choose at least one rewrite that has style errors, and at least one rewrite that changes the meaning of the sentence.”

- Soylent-is, a prototype...
- Soylent-is-a prototypes...
- Soylent is a prototypetest...

# Verify

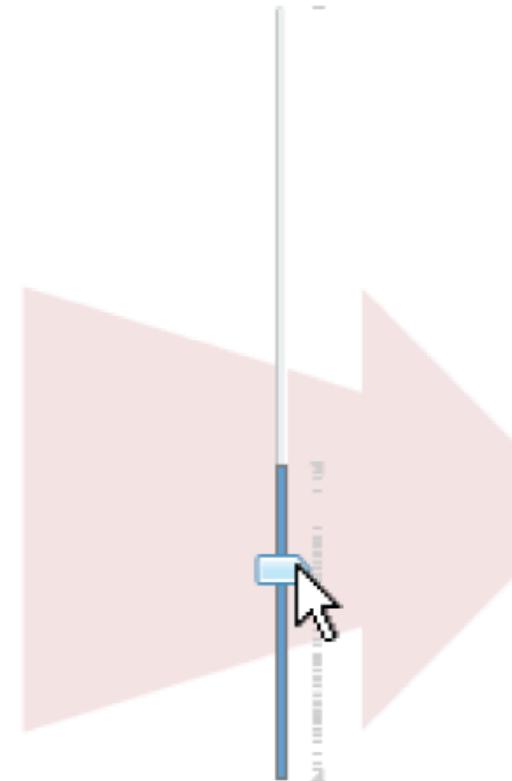

“Choose at least one rewrite that has style errors, and at least one rewrite that changes the meaning of the sentence.”

- Soylent ~~is~~, a prototype...
- Soylent ~~is a~~ prototypes...
- Soylent is a ~~prototype~~test...

Keep suggestions that do not get voted out

Automatic clustering generally helps separate different kinds of records that need to be edited differently, but it isn't perfect. Automatic clustering generally helps separate different kinds of records that need to be edited differently, but it isn't perfect. Sometimes it creates more clusters than needed, because the differences in structure aren't relevant to a specific task. | Conversely, sometimes the clustering isn't fine enough, leaving heterogeneous clusters that must be edited one line at a time. One solution to this problem would be to let the user rearrange the clustering manually using drag-and-drop edits. Clustering and selection generalization would also be improved by recognizing common text structure like URLs, filenames, email addresses, dates, times, etc.

# Mechanical Novel

[Kim et al. 2017]

Could we crowdsource the Great American Novel?

Unlike most crowdsourcing workflows, creative work requires tight interconnections between different parts of a story, and between the high-level goal and low-level text

**Reflect**

choose a high-level goal

**Revise**

break into tasks and edit

# The Hot Air Balloon

A young boy named Malcolm finds himself alone in a runaway hot air balloon and accidentally travels to a city in the sky.

Malcolm found himself fascinated by the balloon.

#1

+

He imagined what it would be like to fly to some exotic location, soaring above the clouds. He closed his eyes and saw himself flying through the clouds. "Hey you!" he heard a voice shout.

"What are you doing in my balloon!" The operator yelled as he dropped his snack and ran toward the balloon. Malcolm, startled by the man stumbled. Trying not to fall he reached out and grabbed a rope hanging next to him. As he pulled it, it released the ballast and the balloon leapt into the air. Before he knew it he was rising up

relief as he felt the balloon descend a bit. Then suddenly a great gust of wind took the balloon and sent it higher and higher. Fell to the floor, grabbing a lever on the way down that made the balloon rise even faster.

Answer the following questions about the story:

**What did you like about the story above?**

I liked the sen|

**What do you wish you could change about the story above?**

I wish...

**Is the wish you wrote above mostly about the plot, the characters, or the writing? (select one)**

Choose...

**In one sentence, suggest something for the next revision of the story that could change to address your comments above.**

Start your sentence with the words "What if...". Try to write something specific that fits the story.

What if...

**Submit**

the story above! Which change should be the main change for the next revision?

---

ut the  
do you

**Think about what you wish you could change about the story. Which statement below do you agree with most?**

detail and  
imagine  
oughout.

I wish there would be a bit more exposition at the beginning of the story. The events all start very quickly and it's easy to not understand what's going on.

hot air balloon

The order of the paragraphs. It jumped all over the place.

the previous  
used and it's  
iting than

I want to see more exciting things happen to Malcom in Cloud City, and I want to know about his return to the ground.

**Which new idea below do you think should be the main change for a revision of the story above?**

What if instead of beginning so abruptly, we learned a little more about Malcolm first?

What if... We wrote a new story about hot air balloons and a mistaken escape?

What if Malcom investigates the Cloud City and then tries to get home, maybe bringing along a friend from Cloud City.

Make the following change to the text on the left:

*First, there is a typo ("she he") should be "should he". Finish paragraph with:  
Perhaps he should take a little gander and see if he can get some help with the  
balloon.*

When he woke up, he found himself staring at glow of big, beautiful crystal-like glass buildings, shimmering in the brilliant sunshine. One was emerald green, another ruby red, still another sparkling like diamonds, others radiating spectacular colors he had never seen. He was a little scared, to be in an unfamiliar place, but he was mostly curious. He could sense that something interesting

He suddenly found himself staring at gargantuan glass buildings, their exteriors shimmering under the sun's rays. These buildings were like no others he'd seen before - one was emerald colored, another ruby red, and a third sparkling like a multifaceted diamond. This scenery was frightening, yet, he was curious. Something was going on in this city, and it could be something wonderful. Maybe there were helpful people down below? Perhaps he should take a little gander and see if he can get some help with the balloon.

# Flash Teams

[Retelny et al., UIST '14]

Computationally-guided teams of crowd experts supported by lightweight team structures.

Input

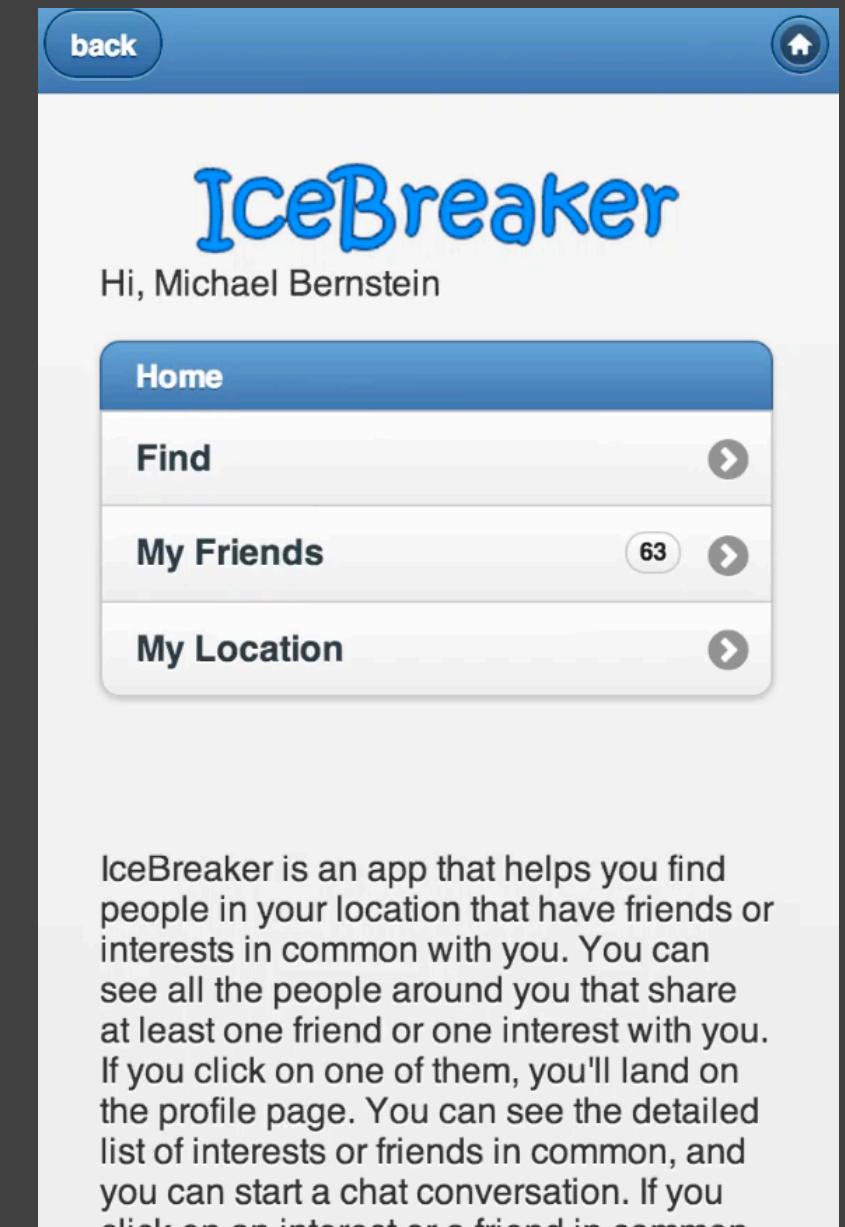

Flash Team

Design workflow

Output

What crowdsourcing  
can't do

# Limits of algorithmic coordination

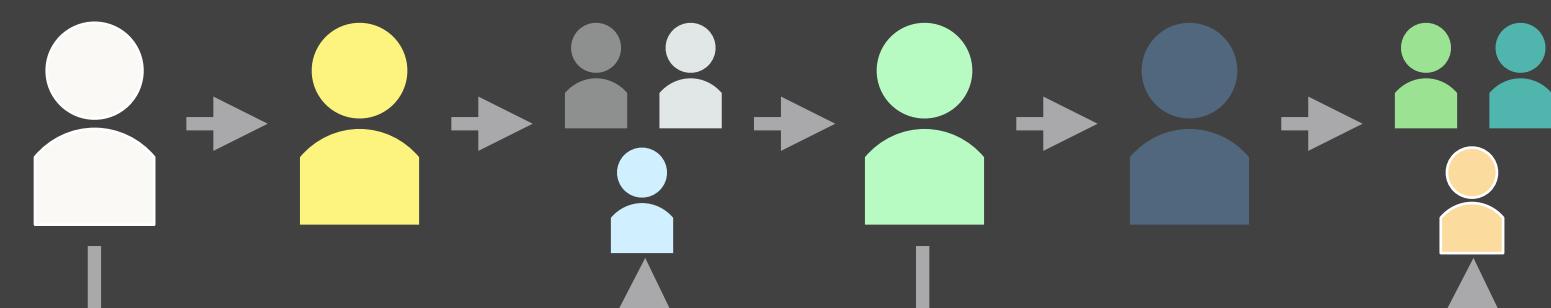

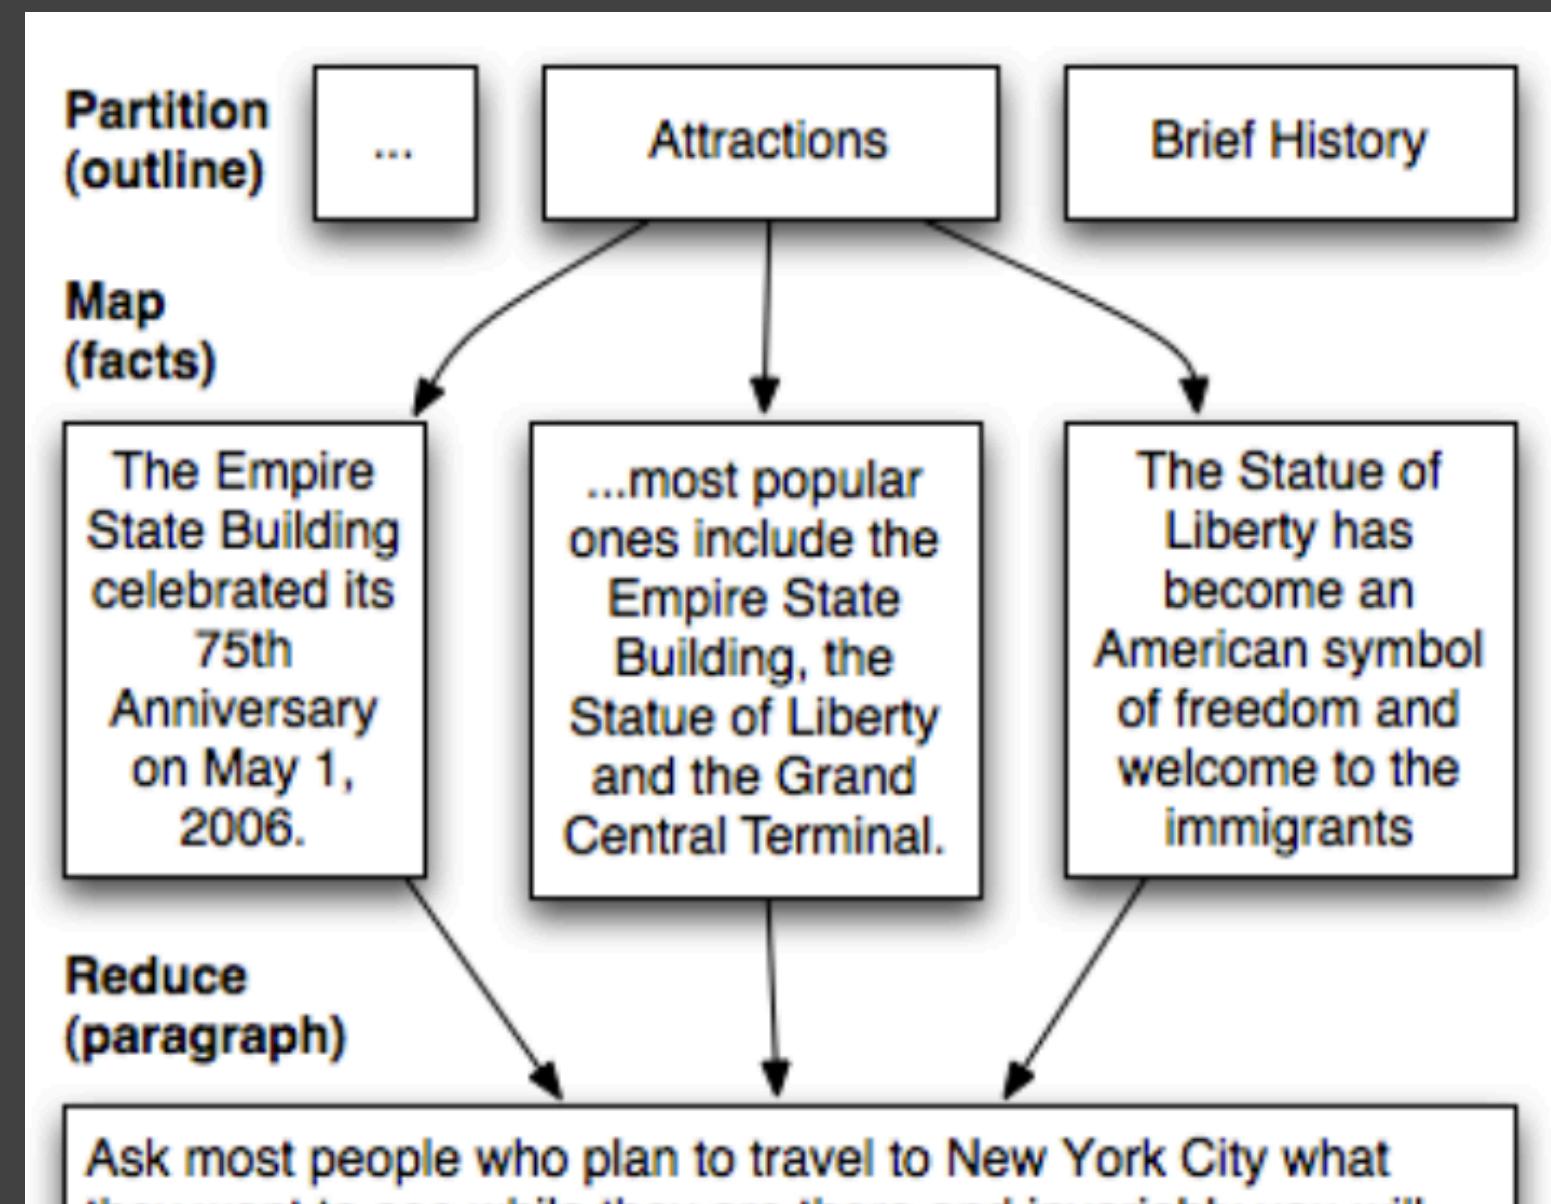

So far, goals such as invention, production, and engineering have remained largely out of reach [Kittur et al. 2013]

Why? [1 min]

# Dominant architecture: algorithms

Modularize and pre-define all possible behaviors into workflows

Computation decides which behaviors are taken, when, and by whom; optimizes, error-checks, and combines submissions

[Little 2009; Little 2010]  
[Dai and Weld 2010]

# Limits of algorithmic coordination

Returning to the question: why have complex goals remained largely out of reach?

Open-ended, complex goals are fundamentally incompatible with a requirement to modularize and pre-define every behavior [Van de Ven, Delbecq, and Koenig 1976; Rittel and Webber 1973; Schön 1984]

# Of course, workflows cause issues...

[Retelny et al. 2017]

Workflows are inflexible and can become games of telephone, where intent gets lost and errors can propagate over time

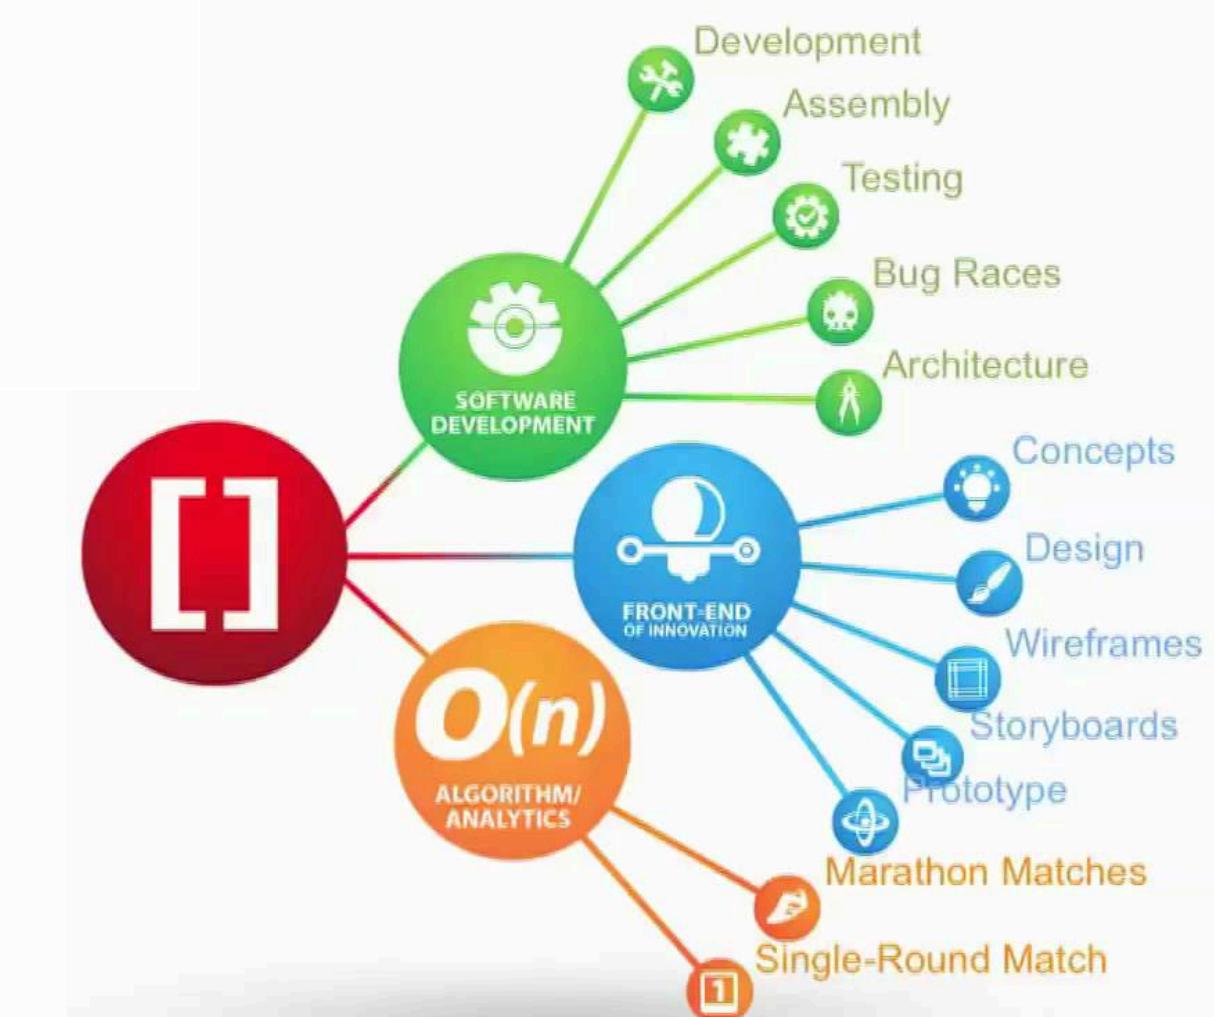

# Limits of crowdsourcing and peer production

“Peer production is limited not by the total cost or complexity of a project, but by its modularity.” [Benkler 2002]

“With the Linux kernel [...] we want to have a system which is as modular as possible. The open-source development model really requires this, because otherwise you can't easily have people working in parallel.” [Torvalds 1999]

## HOW TOPCODER ATOMIZES PROJECTS INTO THEIR COMPONENTS

[Boudreau, Lacetera, and Lakhani 2011]

# Interdependence and collective action remain challenging

The result: algorithmic, workflow-based architecture confines collaborations to goals so predictable that they can be entirely modularized and pre-defined.

But many valuable collective activities do not fit this criteria.

# Why are these challenging?

Convergence: crowds are excellent at generating ideas and at spreading awareness, but it's much more challenging for them to build consensus toward a single action.

# Convergence

**Danielle Henderson**

@knottyyarn

Big ups to those participating in [#WomenBoycottTwitter](#) but the foundation of my feminism is about NOT being silenced.

2,378 504 people are talking about this

**Elizabeth Minkel**

@elizabethminkel

I think as a tool of economic activism, this thing was too slipshod to be effective—and that women of color are spot-on in their critiques.

10 See Elizabeth Minkel's other Tweets

[Example via Niloufar Salehi]

# Why are these challenging?

Coordinated adaptation: changing direction in sync with each other.

Crowds are excellent at executing pre-defined tasks, but it's much more challenging for them to continually re-evaluate goals and adapt in sync.

# Hybrid peer production

Why is it that many successful peer production projects form either nonprofits or for-profit organizations to support their efforts?

Nonprofit: PyTorch (PyTorch Found.), Kubernetes (CNCF), Django (DSF)

For profit: Docker (Docker, Inc.), Ubuntu (Canonical), MySQL (Oracle)

Peer production struggles with tasks that traditional contract-based firms achieve (e.g., keeping release schedules, integrated contributions). So, they form hybrid models to compensate.

Example: supposedly simple goal for Ubuntu—plugging a USB drive and the drive appearing on your desktop

# Ratatouille TikTok musical

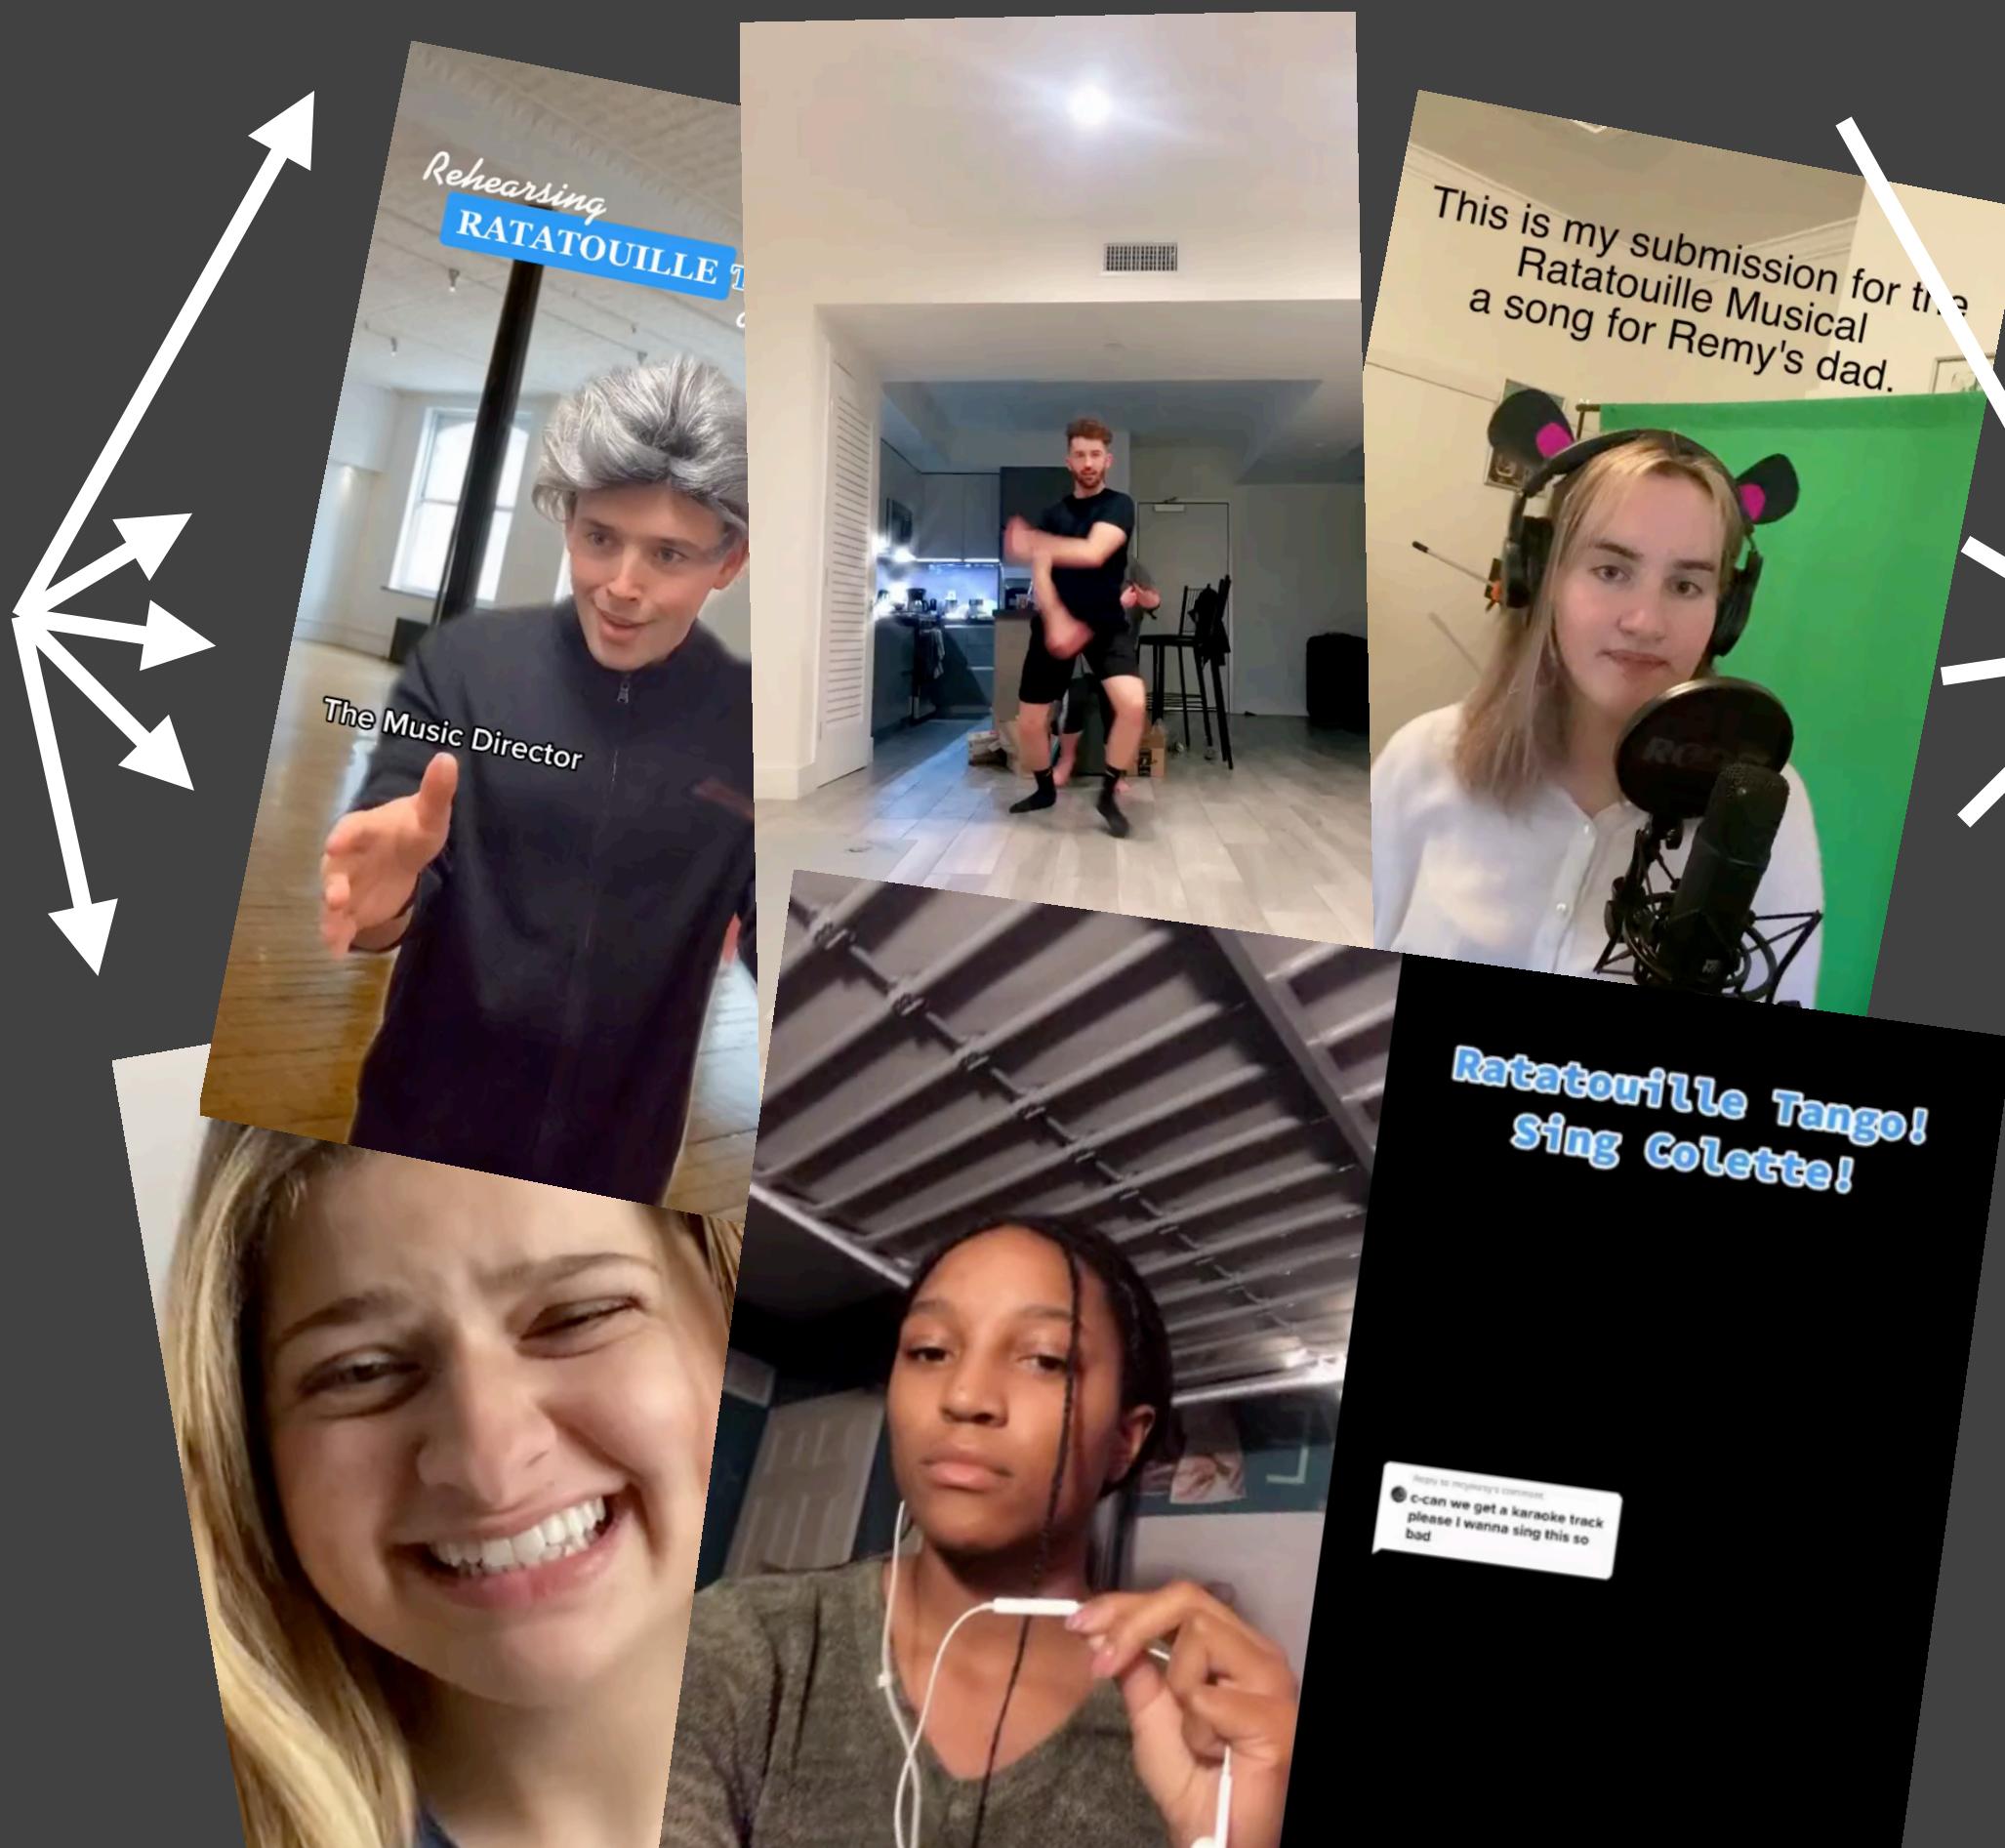

Seed idea

Structure

Divergence

Convergence

Required a focused team

# Has your opinion changed?

When would you opt for peer production over firm-based production, assuming you had moderate but not infinite funds?

Which would you use if the goal were to:

- Write a lecture for CS 278?
- Redesign the requirements for your major?
- Decide on the future of Stanford neighborhoods?

[2min]

# Exam

Closed-book exam on paper

Questions sampled from the question bank of top questions from voting. Question bank posted in advance.

Roughly 1/4 Easy questions, 1/4 Medium questions, 1/4 Hard questions...

And 1/4 staff-written questions

Study groups OK, but no collaboration on or sharing notes or answers

Details on the website

# Summary

Shifting from simple wisdom-of-the-crowd tasks requires much more than just a scaling up of ambition: it requires designing for interdependence.

Peer production — the term encompassing shared open work (e.g., Wikipedia, open source) is one powerful method for volunteer coordination. Workflows and algorithms offer another approach. Both have their issues.

Aiming higher means we will need to solve issues of convergence and coordinated adaptation.
