

How to make computers work like the brain

(without really solving the brain)

Dileep George

“a single special machine can be made to do the work of all. It could in fact be made to work as a model of any other machine.”
Alan Turing 1937

Neocortex

- Assume that:
 - Neocortex uses the same algorithm to learn different modalities
 - Neocortex learns efficiently

The No Free Lunch Theorem

The No Free Lunch Theorem

No learning algorithm has an inherent superiority over other learning algorithms for all problems.

(Wolpert, 1995)

The No Free Lunch Theorem

No learning algorithm has an inherent superiority over other learning algorithms for all problems.

(Wolpert, 1995)

An algorithm's superiority comes from the assumptions that it makes about the problem

Neocortex

- Assume that:
 - Neocortex uses the same algorithm to learn different modalities
 - Neocortex learns efficiently

Neocortex

- Assume that:
 - Neocortex uses the same algorithm to learn different modalities
 - Neocortex learns efficiently

=> Data from different modalities must have the same underlying statistical structure

The right question to ask..

- Are there assumptions we can make about the world that are
 1. General enough to be applied to be a large number of problems
 2. Specific enough to make learning possible ??

High-level properties of the neocortex

- Hierarchical organization
 - Spatial and temporal
- Using time as a supervisor
- Ability to make predictions
- Sparse Distributed Representations
- Feed-forward and feedback connections
- Sensori-motor

State-splitting model

Learn first
order model

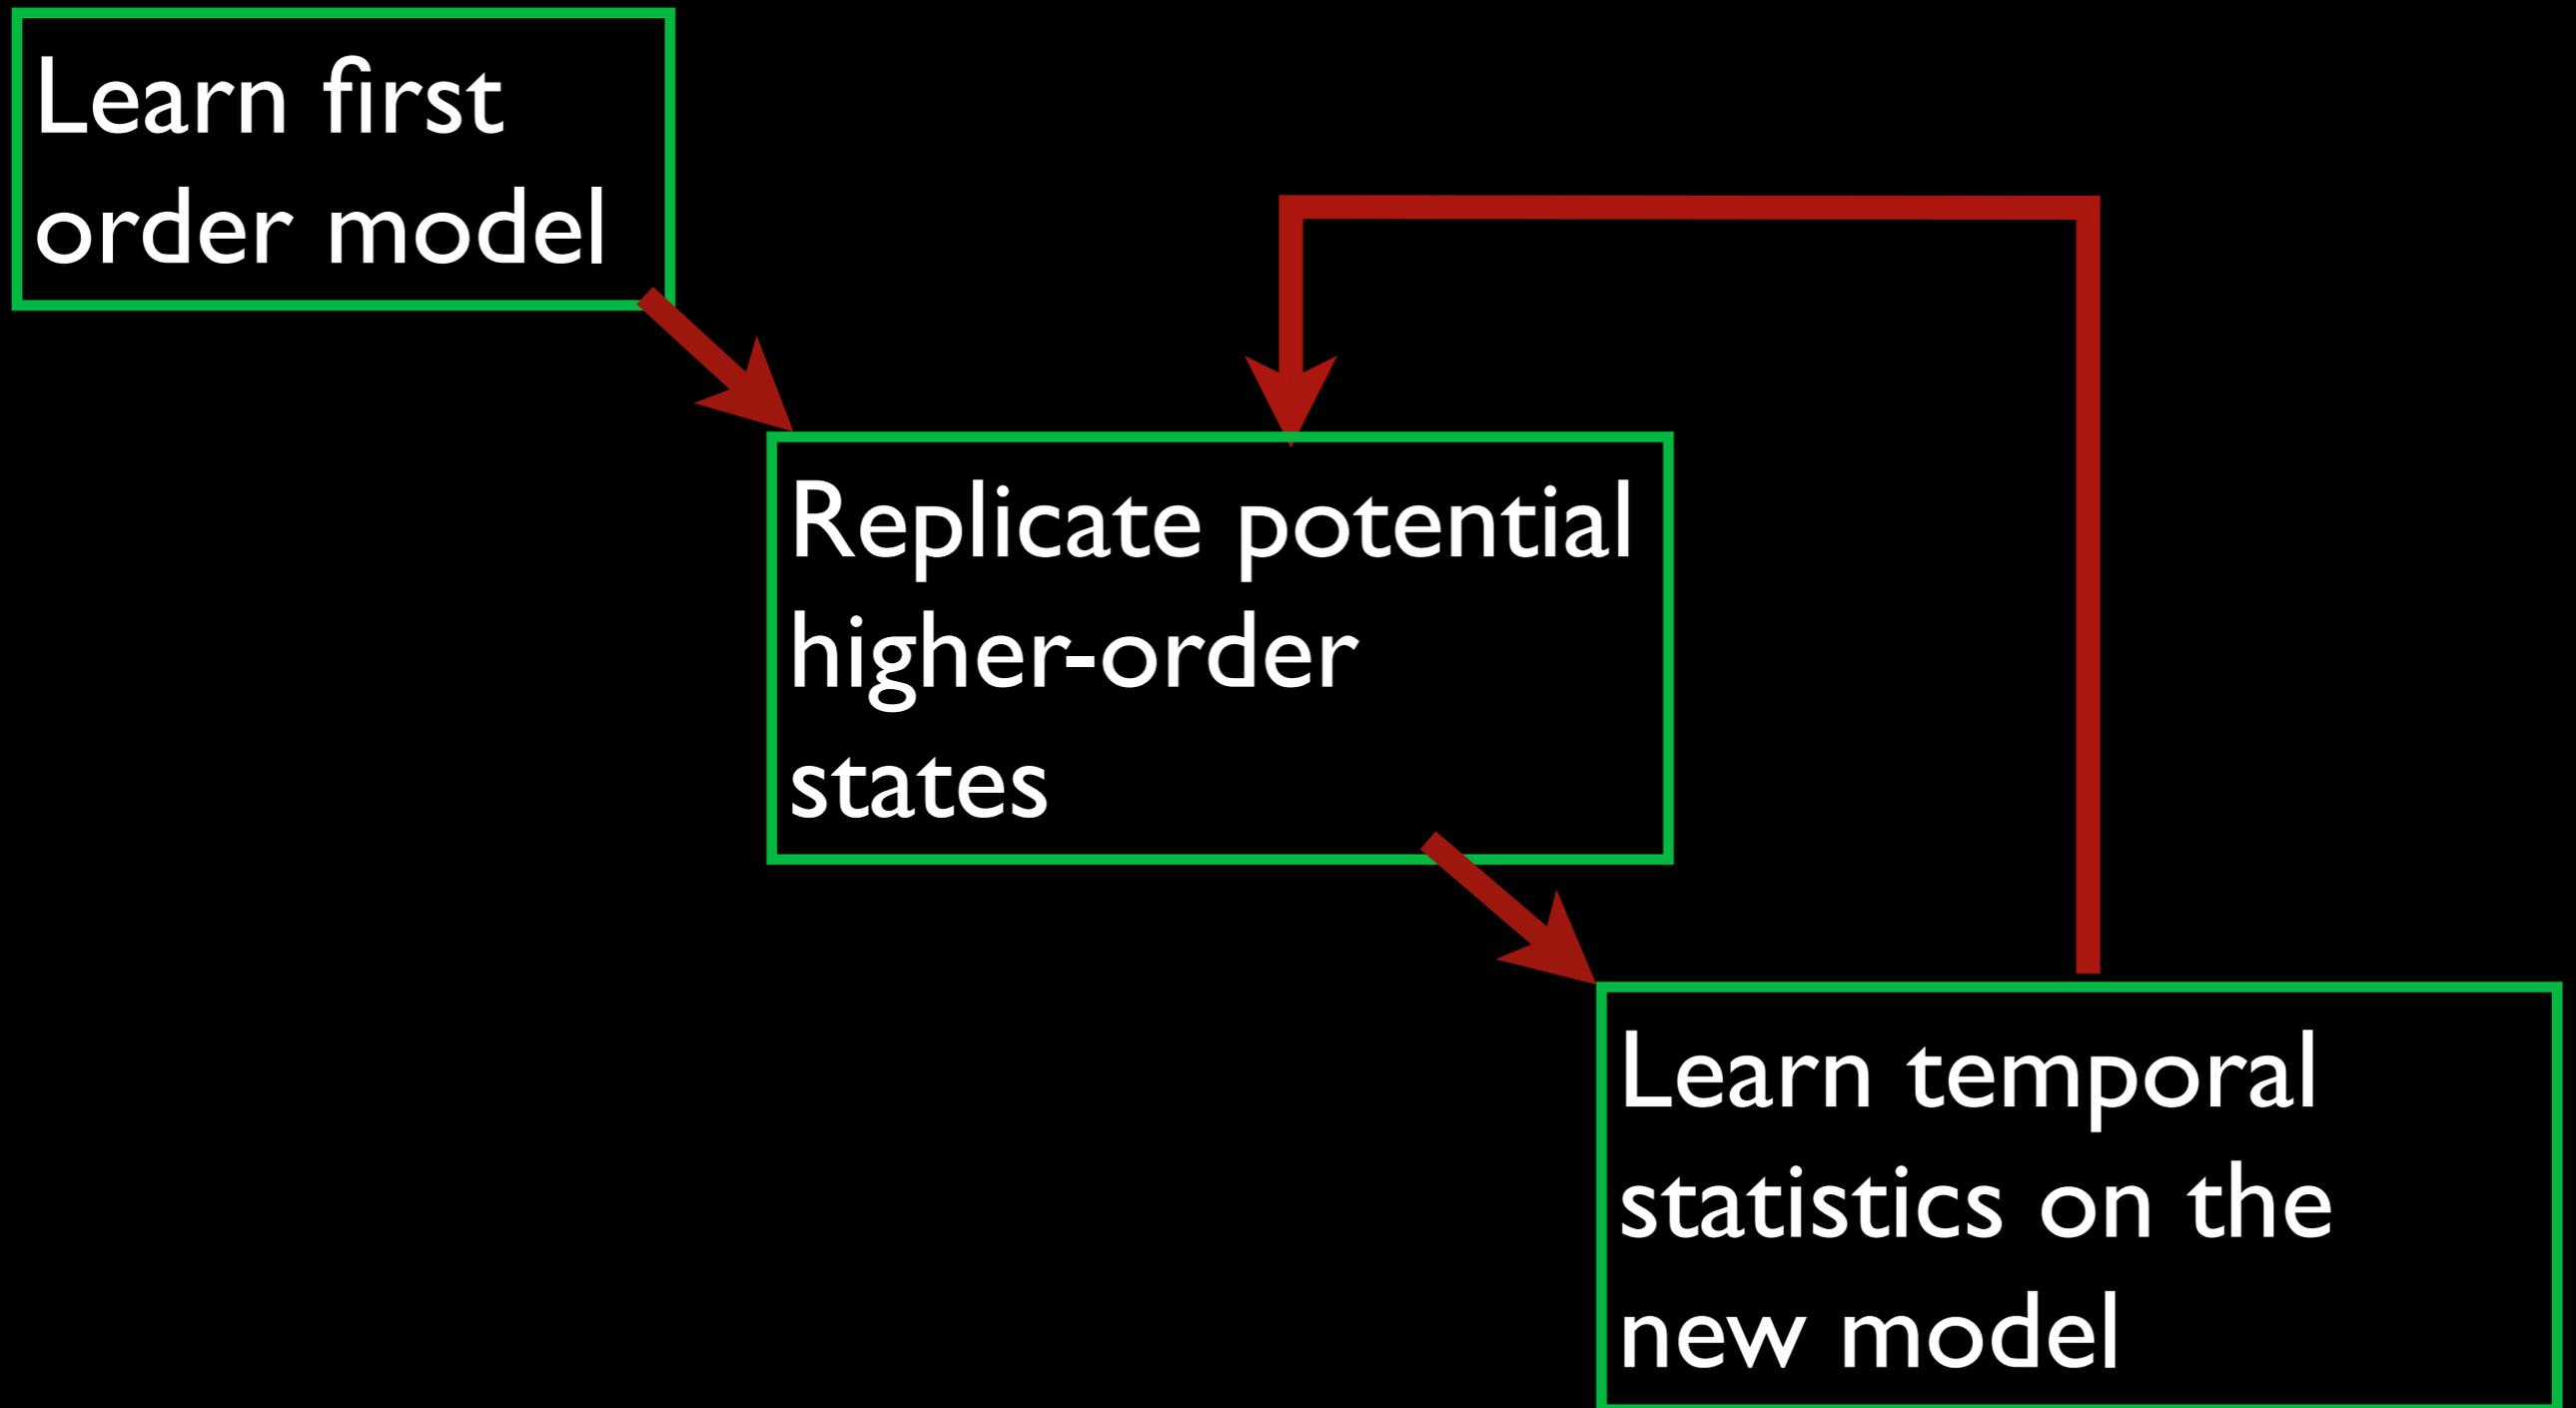

```
graph TD; A[Learn first order model] --> B[Replicate potential higher-order states]; B --> C[Learn temporal statistics on the new model];
```

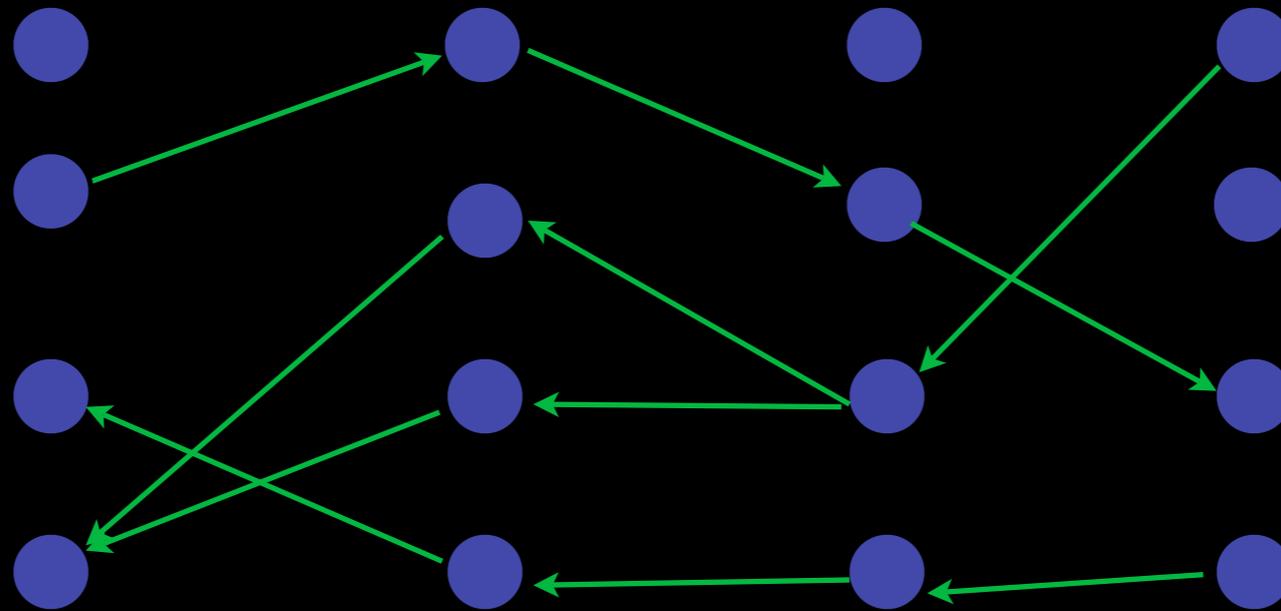

The diagram illustrates a three-step process for a state-splitting model. It begins with a box labeled 'Learn first order model', which has a red arrow pointing to a second box labeled 'Replicate potential higher-order states'. From this second box, another red arrow points to a final box labeled 'Learn temporal statistics on the new model'. All three boxes are outlined in green.

Replicate potential
higher-order
states

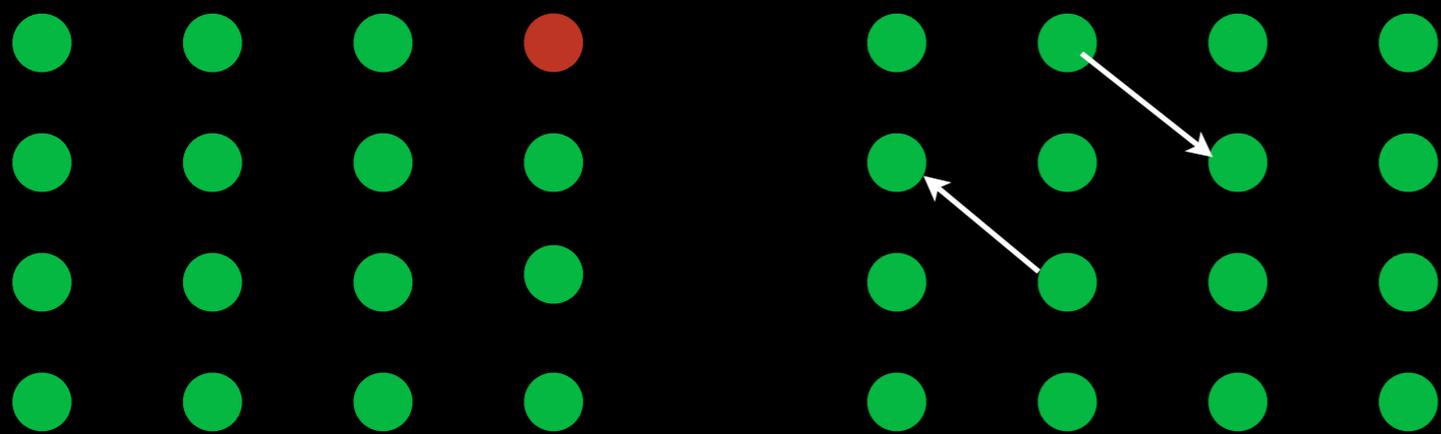

Learn temporal
statistics on the
new model

State-splitting model

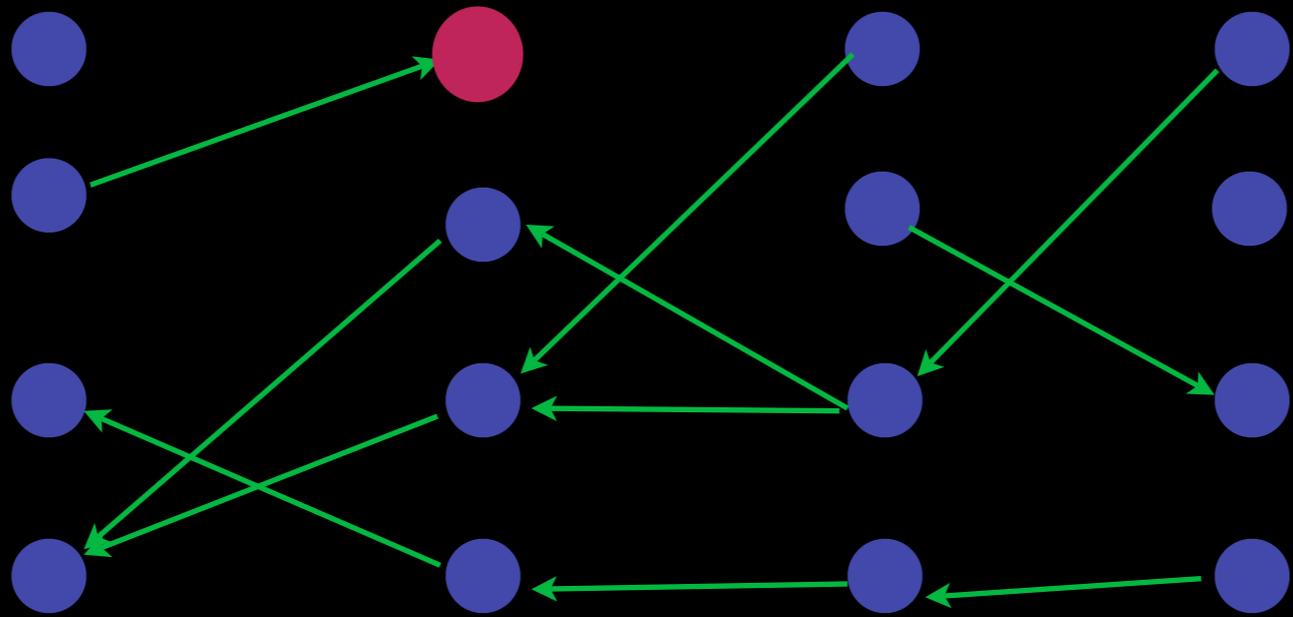

- Start with replicated states
- Should be online
- Should still be sparse and efficient

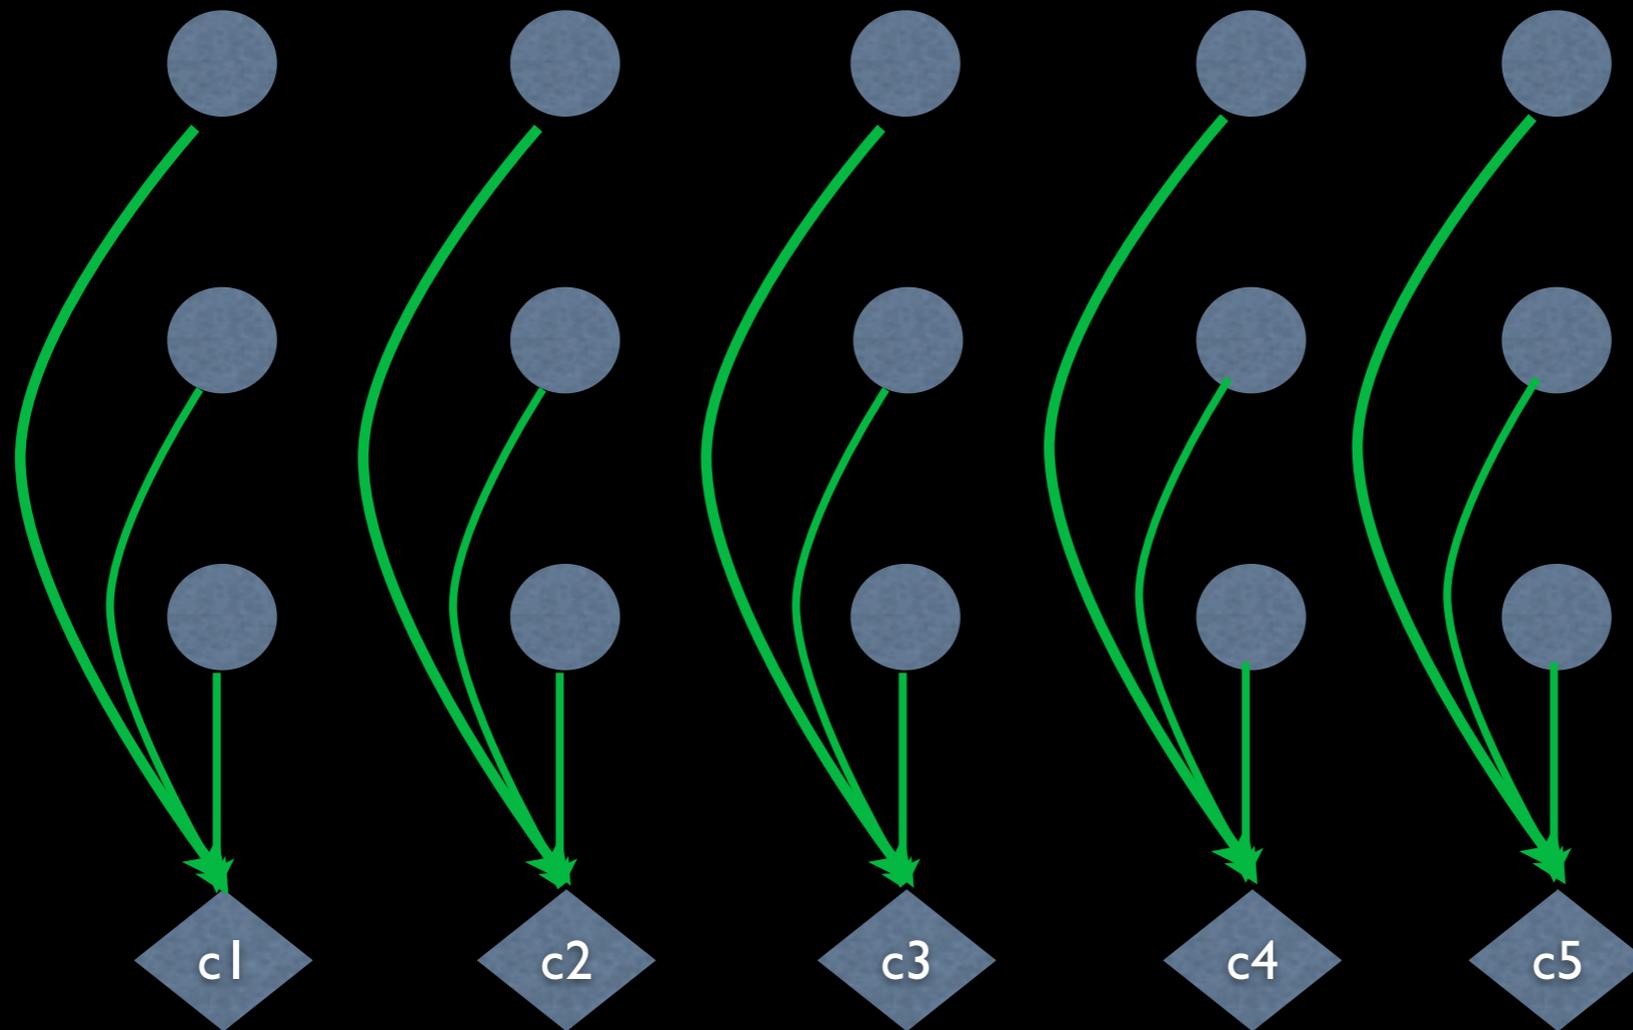

t

$t+1$

Which cell in this column do we connect to?

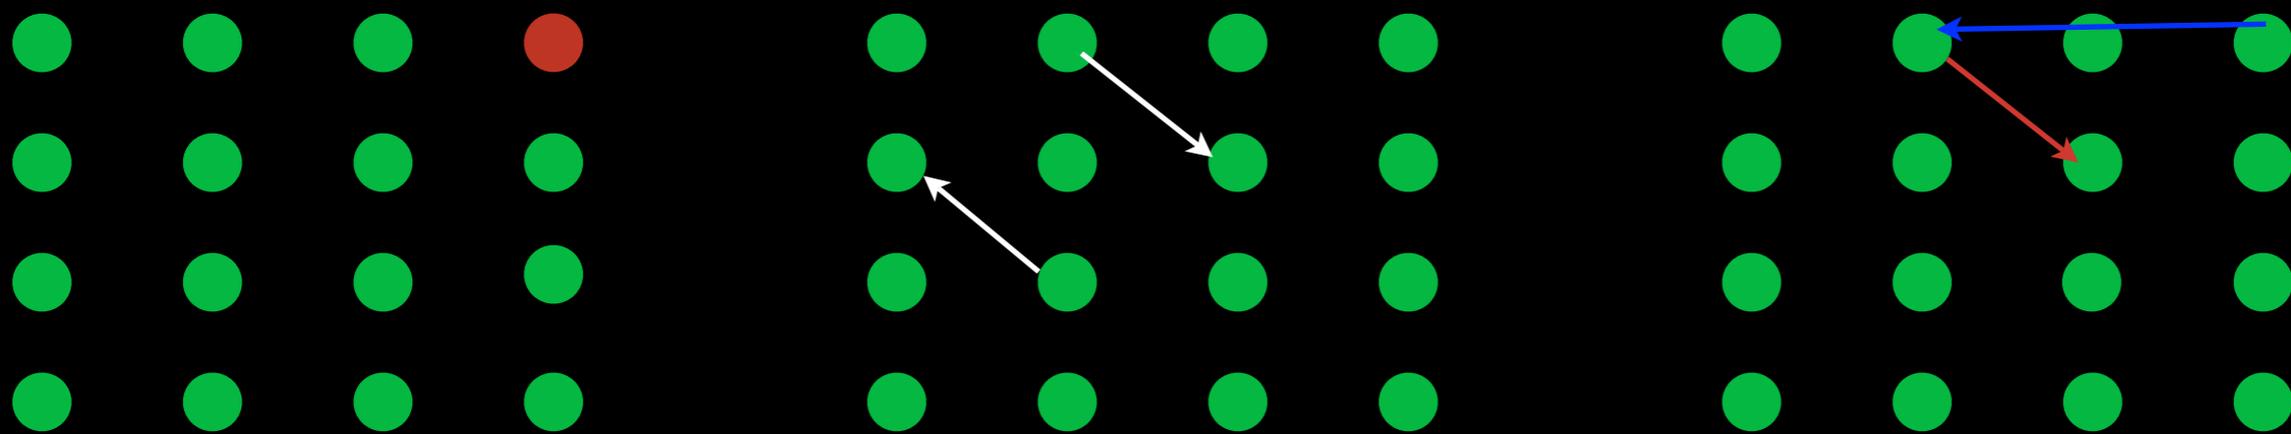

Connection to HMM

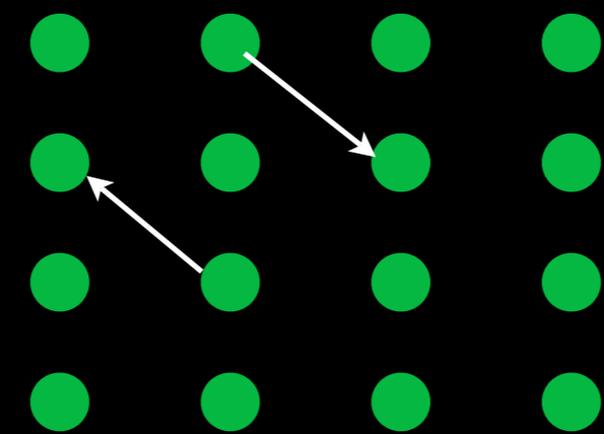

HMM and Forward-Backward

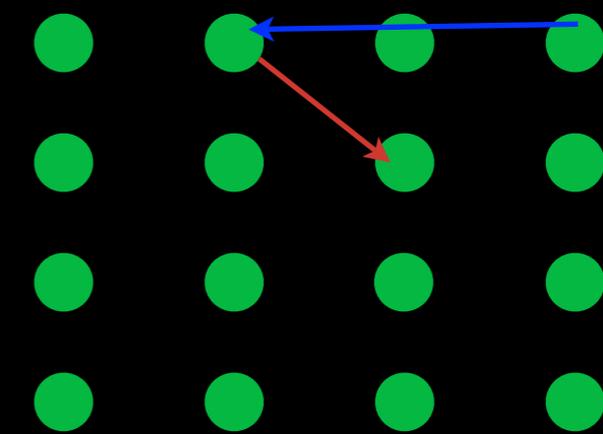

- Forward-backward algorithm
- On the restricted HMM, works very well in finding the higher-order states
- Can be made online by making reducing the look-ahead
- One step look-ahead works quite well
- Zero look-ahead (pure Hebbian learning) doesn't work well.

t

$t+1$

$t+2$

Which cell in this column do we connect to?

Biological implication

Can A know whether B was
successful in firing C?

The answer is YES

articles

Enhancement of presynaptic neuronal excitability by correlated presynaptic and postsynaptic spiking

Karunesh Ganguly^{1,2}, Laszlo Kiss² and Mu-ming Poo^{1,2}

¹ Program in Neuroscience, University of California at San Diego, La Jolla, California 92093-0357, USA

² Department of Biology, University of California at San Diego, La Jolla, California 92093-0357, USA

The first two authors contributed equally to this work

Correspondence should be addressed to M.-m.P. (mpoo@ucsd.edu)

Use-dependent modifications, such as long-term potentiation (LTP) of synaptic efficacy, are believed to be essential for information storage in the nervous system. Repetitive correlated spiking of presynaptic and postsynaptic neurons can induce LTP at excitatory glutamatergic synapses. In cultured hippocampal neurons, we show that repetitive correlated activity also results in a rapid and

tion, the increased frequency of presynaptic firing following correlated spiking may facilitate the induction of bursting-like behavior and enhance the reliability of signal transmission³⁵. Enhancement of presynaptic neuronal excitability will also affect the plasticity of 'upstream' synapses made onto the presynaptic neuron by facilitating the initiation of backpropagating action potentials^{6,11,36}.

Recipe for building brain-like computers

- Accept the broad biological constraints
 - Hierarchy, time as supervisor, sparse distributed representations, sensori-motor interactions....
- Have a biological circuit model for the learned system
 - Put in biological details you can computationally justify
- Get to the biological circuit model using the most expedient learning algorithm
 - Need not be biological. In fact, being biological can be a disadvantage.
- Work on a real problem

On to the paper...

- Can we come to a set of mathematical equations that model cortical function?

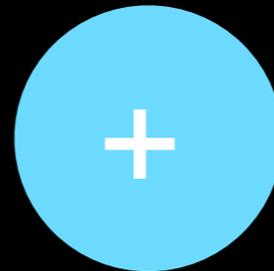

- Can we come to a set of mathematical equations that model cortical function?
- Something like Maxwell's equations for electromagnetic waves

- Can we come to a set of mathematical equations that model cortical function?
- Something like Maxwell's equations for electromagnetic waves
- Assigns functions/equations for laminar circuits

- Can we come to a set of mathematical equations that model cortical function?
