

# STATISTICS

*Emeriti:* Theodore W. Anderson, Albert Bowker, M. Vernon Johns, Lincoln E. Moses, Ingram Olkin, Charles Stein

*Chair:* Trevor J. Hastie

*Professors:* Thomas M. Cover, Amir Dembo, Persi Diaconis, David L. Donoho, Bradley Efron, Jerome H. Friedman, Trevor J. Hastie, Iain M. Johnstone, Tze L. Lai, Art Owen, Joseph P. Romano, David O. Siegmund, Paul Switzer, Robert J. Tibshirani, Wing H. Wong

*Associate Professor:* Guenther Walther

*Assistant Professors:* Andrea Montanari, Jonathan Taylor

*Professor (Teaching):* Susan Holmes

*Courtesy Professor:* Richard A. Olshen

*Courtesy Associate Professors:* Simon Jackman, David Rogosa

*Consulting Professor:* Charles Chui

*Mail Code:* 94305-4065

*Phone:* (650) 723-2620

*Web Site:* <http://www-stat.stanford.edu>

Courses given in Statistics have the subject code STATS. For a complete list of subject codes, see Appendix.

The department's goals are to acquaint students with the role played in science and technology by probabilistic and statistical ideas and methods, to provide instruction in the theory and application of techniques that have been found to be commonly useful, and to train research workers in probability and statistics. There are courses for general students as well as those who plan careers in statistics in business, government, industry, and teaching.

The requirements for a degree in Statistics are flexible, depending on the needs and interests of the students. Some students may be interested in the theory of statistics and/or probability, whereas other students may wish to apply statistical and probabilistic methods to a substantive area. The department has long recognized the relation of statistical theory to applications. It has fostered this by encouraging a liaison with other departments in the form of joint and courtesy faculty appointments: Economics (Anderson), Education (Olkin, Rogosa), Electrical Engineering (Cover), Geological and Environmental Sciences (Switzer), Health Research and Policy (Efron, Hastie, Johnstone, Moses, Olshen, Tibshirani, Wong), Mathematics (Dembo, Diaconis), Political Science (Jackman), and the Stanford Linear Accelerator (Friedman). The research activities of the department reflect an interest in both applied and theoretical statistics, and probability. There are workshops in biology-medicine and in environmental factors in health.

In addition to courses for Statistics majors, the department offers a number of service courses designed for students in other departments. These tend to emphasize the application of statistical techniques rather than their theoretical development.

The Department of Statistics is well equipped for statistical applications and research in computational statistics. Computer facilities include several networked Unix servers and a PC lab for general research and teaching use. The Mathematical Sciences Library serves the department jointly with the departments of Mathematics and Computer Science.

The department has always drawn visitors from other countries and universities. As a consequence, there is usually a wide range of seminars offered by both the visitors and our own faculty.

## UNDERGRADUATE PROGRAMS

### MAJOR

Students wishing to build a concentration in probability and statistics are encouraged to consider declaring a major in Mathematical and Computational Science. This interdepartmental program is administered in the Department of Statistics and provides core training in computing, mathematics, operations research, and statistics, with opportunities for further elective work and specialization. See the "Mathematical and Computational Science" section of this bulletin.

## MINORS

The undergraduate minor in Statistics is designed to complement major degree programs primarily in the social and natural sciences. Students with an undergraduate Statistics minor should find broadened possibilities for employment. The Statistics minor provides valued preparation for professional degree studies in postgraduate academic programs.

The minor consists of a minimum of six courses with a total of at least 20 units. There are two required courses (8 units) and four qualifying or elective courses (12 or more units). An overall 2.75 grade point average (GPA) is required for courses fulfilling the minor.

1. *Qualifying Courses:* at most, one of these two courses may be counted toward the six course requirement for the minor: MATH 52; STATS 191.

2. *Required Courses:* STATS 116 and 200.

3. *Elective Courses:* at least one of the elective courses should be a STATS 200-level course. The remaining two elective courses may also be 200-level courses. Alternatively, one or two elective courses may be approved courses in other departments. Special topics courses and seminars for undergraduates are offered from time to time by the department and these may be counted toward the course requirement. Examples of elective course sequences are:

STATS 202, 203, emphasizing data analysis and applied statistics

STATS 205, 206, (207), emphasizing statistical methodology

STATS 206, ECON 160, emphasizing economic optimization

STATS 206, PSYCH 156, emphasizing psychology modeling and experiments

STATS 207, EE 264, (279), emphasizing signal processing

STATS 217, BIOSCI 283, emphasizing genetic and ecologic modeling

STATS 217, 218, emphasizing probability and its applications

STATS 240, 250, emphasizing mathematical finance

## GRADUATE PROGRAMS

### MASTER OF SCIENCE

The department requires that the student take 45 units of work from offerings in the Department of Statistics or from authorized courses in other departments. Ordinarily, four or five quarters are needed to complete all requirements.

Student must fulfill the following requirements for the M.S. degree:

1. STATS 116, 200, 191, and 217. Courses previously taken may be waived by the adviser, in which case they must be replaced by other graduate courses offered by the department.

2. One of MATH 103, 113, 115, 171; and one of CS 106A, 106X, 137. Substitution of other courses in Mathematics and Computer Science may be made with consent of the adviser.

3. At least four additional courses from graduate offerings in the department (202-399). Consent of the adviser is required in order to take more than 6 units of STATS 260A,B,C, 390, or 399.

4. Additional units to complete the requirements may be chosen from the list available from the department web site. Other graduate courses (200 or above) may be authorized by the adviser if they provide skills relevant to statistics or deal primarily with an application of statistics or probability and do not overlap courses in the student's program. There is sufficient flexibility to accommodate students with interests in applications to business, computing, economics, engineering, health, operations research, and biological and social sciences.

Students with a strong mathematical background who may wish to go on to a Ph.D. in Statistics should consider applying directly to the Ph.D. program.

Statistics courses required for the M.S. degree must be taken for letter grades, and an overall 2.75 grade point average (GPA) is required.

## DOCTOR OF PHILOSOPHY

The department looks for students who want to prepare for research careers in statistics or probability, either applied or theoretical. Advanced undergraduate or master's level work in mathematics and statistics provides a good background for the doctoral program. Quantitatively oriented students with degrees in other scientific fields are also encouraged to apply for admission. The program normally takes four years to complete.

**Program Summary**—STATS 300A,B,C, 305, 306A,B, and 310A,B,C (first-year core program); pass two of three parts of the qualifying examination (beginning of second year); breadth requirement (second or third year); University oral examination (end of third year or beginning of fourth year); dissertation (fourth year).

In addition, students are required to take 9 units of advanced topics courses offered by the department (including at least two of the following: 314, 317, 318, 315A, or 315B, but not including literature, research, or consulting), and 3 units of statistical consulting. All students who have passed the qualifying exam but have not yet passed the University oral examination must take 319 at least once per year.

**First-Year Core Courses**—STATS 300 systematically surveys the ideas of estimation and of hypothesis testing for parametric and nonparametric models involving small and large samples. 305 is concerned with linear regression and the analysis of variance. 306 surveys a large number of modeling techniques, related to but going beyond the linear models of 305. 310 is a measure-theoretic course in probability theory, beginning with basic concepts of the law of large numbers and martingale theory. Students who do not have enough mathematics background can take 310 after their first year but need to have their first-year program approved by the Ph.D. program adviser.

**Qualifying Examinations**—These are intended to test the student's level of knowledge when the first-year program, common to all students, has been completed. There are separate examinations in the three core subjects of statistical theory and methods, applied statistics and probability theory, and all are typically taken during the summer between the student's first and second years. Students may take two or three of these examinations and are expected to show acceptable performance in two examinations.

**Breadth Requirement**—Students are advised to choose an area of concentration in a specific scientific field of statistical applications; this can be realized by taking at least 15 units of course work approved by the Ph.D. program adviser.

Current areas with suggested course options include:

**Computational Biology and Statistical Genomics**—Students are expected to take 9 units of graduate courses in genetics or neurosciences (imaging), such as GENE 203/BIOSCI 203, as well as 9 units of classes in Statistical Genetics or Bioinformatics, GENE 344A,B, STATS 345, STATS 366, STATS 367.

**Machine Learning**—Courses can be chosen from the following list:

Statistical Learning: STATS 315A and 315B

Data Bases: CS 245, 346, 347

Probabilistic Methods in AI: CS 221, 354

Statistical Learning Theory and Pattern Classification: CS 229

**Applied Probability**—Students are expected to take 15 units of graduate courses in some of the following areas:

Control and Stochastic Calculus: MS&E 322, 351, MATH 237, EE 363

Finance: STATS 250, FINANCE 622, MATH 236

Information Theory: EE 376A, 376B

Monte Carlo: STATS 318, 345, 362, MS&E 323

Queueing Theory: GSB 661, 663, MS&E 335

Stochastic Processes: STATS 317, MATH 234

**Earth Science Statistics**—Students are expected to take:

STATS 317, 318, 352

and three courses from the GES or Geophysics departments, such as GES 144 or GEOPHYS 210.

**Social and Behavioral Sciences**—Students are expected to take three advanced courses from the department with an applied orientation such as: STATS 261/262, 324, 343, 354

and three advanced quantitative courses from departments such as Anthropology, Economics, Political Science, Psychology, and Sociology, and the schools of Education, Business, or Medicine.

**University Oral Examination**—The University oral examination is taken on the recommendation of the student's research adviser after the thesis problem has been well defined and some research progress has been made. Usually, this happens early in the student's fourth year. The oral examination consists of a 40-minute presentation on the thesis topic, followed by two question periods. The first question period relates directly to the student's presentation; the second is intended to explore the student's familiarity with broader statistical topics related to the thesis research.

**Financial Support**—Students accepted to the Ph.D. program are offered financial support. All tuition expenses are paid and there is a fixed monthly stipend determined to be sufficient to pay living expenses. Financial support can be continued for five years, department resources permitting, for students in good standing. The resources for student financial support derive from funds made available for student teaching and research assistantships. Students receive both a teaching and research assignment each quarter which, together, do not exceed 20 hours. Students are strongly encouraged to apply for outside scholarships, fellowships, and other forms of financial support.

## PH.D. MINOR

The Department of Statistics devises individual Ph.D. minor programs, but the department urges all graduate students in other fields who wish to have a subspecialty in statistics to study for an M.S. degree instead. The unit requirement for an M.S. degree is 45 units, whereas the number of units required for a minor averages around 30. This difference of 15 units can be made up by the student by including in the M.S. program courses from his or her own field which are related to statistics or applications of statistics.

## COURSES INTRODUCTORY

Introductory courses for any student with an interest in the problems of descriptive statistics and statistical inferences are STATS 30, 50, 60, and 141. These courses have no mathematical prerequisites. STATS 60 and 141 explain the techniques and methods of statistical inference. STATS 60 emphasizes applications in the social sciences and STATS 141 applications in the biological sciences. STATS 60 and 141 can be followed by STATS 191 which explains more advanced methods and their applications.

STATS 110, 116, 200, 217-218 are introductory but have a calculus prerequisite. STATS 110 covers the most important techniques used in the analysis of experimental data in engineering and science. STATS 110 can be followed by STATS 191. STATS 116 provides a general introduction to the theory of probability. It may be followed by STATS 200, which deals with statistical theory, or by 217 and 218, which deal with stochastic processes. The sequence 116, 200 is a two quarter sequence in basic mathematical statistics; the sequence 116, 217, 218 is a one-year course in basic probability theory.

**STATS 43N. Displaying Data: Principles, Computer Graphics, and the Internet**—Stanford Introductory Seminar. Principles of displaying data and envisioning information based on literature and historical examples. Application of these principles to media such as computer graphics and the Internet. Student projects. GER:DB-Math  
3 units, Win (Walther, G)

**STATS 50. Mathematics of Sports**—(Same as MCS 100.) The use of mathematics, statistics, and probability in the analysis of sports performance, sports records, and strategy. Topics include mathematical analysis of the physics of sports and the determinations of optimal strategies. New diagnostic statistics and strategies for each sport. Corequisite: STATS 116. GER:DB-Math  
3 units, Spr (Cover, T)

**STATS 60. Introduction to Statistical Methods: Precalculus**—(Graduate students register for 160; same as PSYCH 10.) Techniques for organizing data, computing, and interpreting measures of central tendency, variability, and association. Estimation, confidence intervals, tests of hypotheses, t-tests, correlation, and regression. Possible topics: analysis of variance and chi-square tests, computer statistical packages. GER: DB-Math

*5 units, Aut (Walther, G), Win (Thomas, E), Spr (Switzer, P),  
Sum (Richards, W)*

**STATS 110. Statistical Methods in Engineering and the Physical Sciences**—Introduction to statistics for engineers and physical scientists. Topics: descriptive statistics, probability, interval estimation, tests of hypotheses, nonparametric methods, linear regression, analysis of variance, elementary experimental design. Prerequisite: one year of calculus. GER:DB-Math

*4-5 units, Aut (Srinivasan, B), Sum (Staff)*

**STATS 116. Theory of Probability**—Probability spaces as models for phenomena with statistical regularity. Discrete spaces (binomial, hypergeometric, Poisson). Continuous spaces (normal, exponential) and densities. Random variables, expectation, independence, conditional probability. Introduction to the laws of large numbers and central limit theorem. Prerequisites: MATH 52 and familiarity with infinite series, or equivalent. GER:DB-Math

*3-5 units, Aut (Siegmond, D), Spr (Wong, W), Sum (Staff)*

**STATS 121. Probability, Induction, Statistics**—Foundations of randomness and uncertainty with emphasis on philosophical underpinnings. History of probability from Greek and Talmudic sources to Pascal, Fermat, and Bernoulli. The calculus of probability (permutations, the bell-shaped curve). Interpretations of probability (axioms, subjective probability). Psychology of probability (heuristics and biases). The problem of induction. Exchangeability and deFinetti's answer to Hume. Statistical inference. Alternatives and caveats. Prerequisites: calculus at the level of MATH 42. Recommended: probability and statistics. GER:DB-Math

*3 units, not given this year*

**STATS 141. Biostatistics**—(Same as BIOSCI 141.) Statistical methods for biological data. Describing numerical and graphical data; introduction to probability and statistical inference, including hypothesis tests and confidence intervals. Intermediate statistical methods: comparing groups and analysis of variance; analyzing associations and linear and logistic regression; and methods for categorical data such as contingency tables and odds ratio. Content integrated with statistical computing in R. See <http://www-stat.stanford.edu/~rag/stat141>. GER:DB-Math

*4-5 units, Aut (Rogosa, D), Win (Feldman, M)*

**STATS 160. Introduction to Statistical Methods: Precalculus**—(Same as 60, PSYCH 10; see 60.)

*5 units, Aut (Walther, G), Win (Thomas, E), Spr (Switzer, P),  
Sum (Richards, W)*

**STATS 166. Advanced Bioinformatics**—(Graduate students register for 366; same as BIOMEDIN 366.) Emphasis is on analysis of genomic scale data sets with multivariate methods. Comparative genomics: whole genome phylogeny, genome alignment, identification of constrained elements, genomic motif finding, ENCODE project. Functional genomics: interaction networks, random networks, data integration, tests for functional enrichment, network alignment, deterministic and stochastic genetic circuits, data-driven circuit reconstruction. Population genomics: principles of molecular evolution, tests for selection, HapMap, structural variation. Recommended: familiarity with R, Perl, Unix, basic bioinformatics (sequence alignment and protein structure) at the level of BIOC 218 or BIOMEDIN 274.

*2-3 units, Win (Srinivasan, B)*

**STATS 191. Introduction to Applied Statistics**—Statistical tools for modern data analysis. Topics include regression and prediction, elements of the analysis of variance, bootstrap, and cross-validation. Emphasis is on conceptual rather than theoretical understanding. Applications to social/biological sciences. Student assignments/projects require use of the software package R. Recommended: 60, 110, or 141. GER:DB-Math

*3-4 units, Win (Zhang, N)*

**STATS 199. Independent Study**—For undergraduates.

*1-15 units, Aut, Win, Spr, Sum (Staff)*

## CONTINUATION

Courses in this category are designed for use in applications. Generally, they have introductory statistics or probability as prerequisites.

**STATS 200. Introduction to Statistical Inference**—Modern statistical concepts and procedures derived from a mathematical framework. Statistical inference, decision theory; point and interval estimation, tests of hypotheses; Neyman-Pearson theory. Bayesian analysis; maximum likelihood, large sample theory. Prerequisite: 116.

*3 units, Win (Romano, J), Sum (Staff)*

**STATS 201. Design and Analysis of Experiments**—Theory and applications. Factors that affect response. Optimum levels of parameters. How to balance theory and practical design techniques. Prerequisites: basic statistics and probability theory.

*3-5 units, Aut (Khalessi, S)*

**STATS 202. Data Analysis**—Data mining is used to discover patterns and relationships in data. Emphasis is on large complex data sets such as those in very large databases or through web mining. Topics: decision trees, neural networks, association rules, clustering, case based methods, and data visualization.

*3 units, Aut (Staff)*

**STATS 203. Introduction to Regression Models and Analysis of Variance**—Modeling and interpretation of observational and experimental data using linear and nonlinear regression methods. Model building and selection methods. Multivariable analysis. Fixed and random effects models. Experimental design. Pre- or corequisite: 200.

*3 units, Spr (Walther, G)*

**STATS 205. Introduction to Nonparametric Statistics**—Nonparametric analogs of the one- and two-sample t tests and analysis of variance; the sign test, median test, Wilcoxon's tests, and the Kruskal-Wallis and Friedman tests, tests of independence. Nonparametric regression and nonparametric density estimation, modern nonparametric techniques, nonparametric confidence interval estimates.

*3 units, Spr (Zhang, N)*

**STATS 206. Applied Multivariate Analysis**—Introduction to the statistical analysis of several quantitative measurements on each observational unit. Emphasis is on concepts, computer-intensive methods. Examples from economics, education, geology, psychology. Topics: multiple regression, multivariate analysis of variance, principal components, factor analysis, canonical correlations, multidimensional scaling, clustering. Pre- or corequisite: 200.

*3 units, Win (Olshen, R)*

**STATS 208. Introduction to the Bootstrap**—The bootstrap is a computer-based method for assigning measures of accuracy to statistical estimates. By substituting computation in place of mathematical formulas, it permits the statistical analysis of complicated estimators. Topics: nonparametric assessment of standard errors, biases, and confidence intervals; related resampling methods including the jackknife, cross-validation, and permutation tests. Theory and applications. Prerequisite: course in statistics or probability.

*3 units, Win (Efron, B)*

**STATS 209. Understanding Statistical Models and their Social Science Applications**—(Same as EDUC 260X.) Information that statistical modeling can provide in experimental and non-experimental settings emphasizing misconceptions in social science applications such as causal modeling. Text is *Statistical Models: Theory and Practice*, by David Freedman. See <http://www-stat.stanford.edu/~rag/stat209>. Prerequisite: intermediate-level statistical methods including multiple regression, logistic regression, and log-linear models.

3 units, Spr (Rogosa, D)

**STATS 211. Topics in Quantitative Methods: Meta-Analysis**—(Same as EDUC 493B.) Meta-analysis as a quantitative method for combining the results of independent studies enabling researchers to evaluate available evidence. Examples of meta-analysis in medicine, education, and social and behavioral sciences. Statistical methods include nonparametric methods, contingency tables, regression and analysis of variance, and Bayesian methods. Project involving an existing published meta-analysis. Prerequisite: basic sequence in statistics.

1-3 units, Win (Olkin, I)

**STATS 212. Applied Statistics with SAS**—Data analysis and implementation of statistical tools in SAS. Topics: reading in and describing data, categorical data, dates and longitudinal data, correlation and regression, nonparametric comparisons, ANOVA, multiple regression, multivariate data analysis, using arrays and macros in SAS. Prerequisite: statistical techniques at the level of STATS 191 or 203; knowledge of SAS not required.

3 units, Sum (Staff)

**STATS 217. Introduction to Stochastic Processes**—Discrete and continuous time Markov chains, point processes, random walks, branching processes, first passage times, recurrence and transience, stationary distributions.

3 units, Win, Sum (Ross, K)

**STATS 218. Introduction to Stochastic Processes**—Renewal theory, Brownian motion, Gaussian processes, second order processes, martingales.

3 units, Spr, Sum (Montanari, A)

**STATS 219. Stochastic Processes**—(Same as MATH 136.) Introduction to measure theory,  $L_p$  spaces and Hilbert spaces. Random variables, expectation, conditional expectation, conditional distribution. Uniform integrability, almost sure and  $L_p$  convergence. Stochastic processes: definition, stationarity, sample path continuity. Examples: random walk, Markov chains, Gaussian processes, Poisson processes, Martingales. Construction and basic properties of Brownian motion. Prerequisite: 116 or MATH 151 or equivalent. Recommended: MATH 115 or equivalent.

3 units, Aut (Ross, K), Win (Dembo, A)

**STATS 227. Statistical Computing**—Numerical aspects of least squares, nonlinear, and robust regression. Eigenvector-eigenvalue computations and analyses. Monte Carlo methods: generation of uniformly distributed random numbers, generation of special distributions, variance reduction techniques. The complexity of algorithms used in statistics: sorting, computation of quantiles, nearest neighbor search, fast Fourier transform. Prerequisites: statistics at the level of 200, matrix algebra, programming language.

3 units, not given this year

**STATS 237. Time Series Modeling and Forecasting**—Box-Jenkins and Bayesian approaches. State-space and change-point models. Application to revenue prediction, forecasting product demand, and other real world problems. Development and assessment of models and forecasts in practical applications. Hands-on experience with real data.

3 units, Sum (Staff)

**STATS 239A. Workshop in Quantitative Finance**—Topics of current interest.

1 unit, Aut (Lai, T)

**STATS 240. Statistical Methods in Finance**—Regression analysis and applications to pricing and investment models. Principal components and multivariate analysis. Parametric influence. Financial time series. Estimation and modeling of volatilities. Statistical methods for portfolio management. Hands-on experience with financial data.

3-4 units, Aut (Lai, T)

**STATS 241. Statistical Modeling in Financial Markets**—Nonparametric regression and yield curve smoothing. Advanced time series modeling and forecasting. Market risk measures. Substantive and empirical modeling approaches in financial markets. Statistical trading strategies. Prerequisite: 240 or equivalent.

3-4 units, Aut, Spr (Lai, T)

**STATS 243. Introduction to Mathematical Finance**—Interest rate and discounted value. Financial derivatives, hedging, and risk management. Stochastic models of financial markets, introduction to Ito calculus and stochastic differential equations. Black-Scholes pricing of European options. Optimal stopping and American options. Prerequisites: MATH 53, STATS 116, or equivalents.

3-4 units, Sum (Staff)

**STATS 250. Mathematical Finance**—(Same as MATH 238.) Stochastic models of financial markets. Forward and futures contracts. European options and equivalent martingale measures. Hedging strategies and management of risk. Term structure models and interest rate derivatives. Optimal stopping and American options. Corequisites: MATH 236 and 220B or equivalent.

3 units, Win (Papanicolaou, G)

**STATS 252. Data Mining and Electronic Business**—The Internet and related technologies have caused the cost of communication and transactions to plummet, and consequently the amount of potentially relevant data to explode. The underlying principles, statistical issues, and algorithmic approaches to data mining and e-business, with real world examples.

3 units, Spr (Weigend, A)

**STATS 260A,B,C. Workshop in Biostatistics**—(Same as HRP 260A,B,C.) Applications of statistical techniques to current problems in medical science. Enrollment for more than 2 units of credit involves extra reading or consulting and requires consent of instructor.

1-2 units, A: Aut, B: Win, C: Spr (Staff)

**STATS 261. Intermediate Biostatistics: Analysis of Discrete Data**—(Same as BIOMEDIN 233, HRP 261.) The  $2 \times 2$  table. Chi-square test. Fisher's exact test. Odds ratios. Sampling plans; case control and cohort studies. Series of  $2 \times 2$  tables. Mantel-Haenszel. Other tests.  $k \times m$  tables. Matched data logistic models. Conditional logistic analysis, application to case-control data. Log-linear models. Generalized estimating equations for longitudinal data. Cell phones and car crashes: the crossover design. Special topics: generalized additive models, classification trees, bootstrap inference.

3 units, Win (Cobb, K)

**STATS 262. Intermediate Biostatistics: Regression, Prediction, Survival Analysis**—(Same as HRP 262.) Methods for analyzing longitudinal data. Topics include Kaplan-Meier methods, Cox regression, hazard ratios, time-dependent variables, longitudinal data structures, profile plots, missing data, modeling change, MANOVA, repeated-measures ANOVA, GEE, and mixed models. Emphasis is on practical applications. Prerequisites: basic ANOVA and linear regression.

3 units, Spr (Cobb, K)

**STATS 297. Practical Training**—For students in the M.S. program in Financial Mathematics only. Students obtain employment in a relevant industrial or research activity to enhance their professional experience. May be repeated for credit. Prerequisite: consent of adviser.

1-3 units, Aut, Win, Spr, Sum (Lai, T)

**STATS 298. Industrial Research for Statisticians**—Masters-level research as in 299, but must be conducted for an off-campus employer. Final report required. Prerequisite: enrollment in Statistics M.S. or Ph.D. program (prior to candidacy).

1-9 units, Aut, Win, Spr, Sum (Staff)

**STATS 299. Independent Study**—For Statistics M.S. students only. Reading or research program under the supervision of a Statistics faculty member. May be repeated for credit.

*1-10 units, Aut, Win, Spr, Sum (Staff)*

## PRIMARYLY FOR DOCTORAL STUDENTS

Sequences 300A,B,C, 305, 306A,B, and 310A,B,C comprise the fundamental sequence which serves as a general introduction to and prerequisite for further work.

**STATS 300. Advanced Topics in Statistics**—May be repeated for credit.

*3 units, Sum (Staff)*

**STATS 300A,B,C. Theory of Statistics**—Elementary decision theory; loss and risk functions, Bayes estimation; UMVU estimator, minimax estimators, shrinkage estimators. Hypothesis testing and confidence intervals: Neyman-Pearson theory; UMP tests and uniformly most accurate confidence intervals; use of unbiasedness and invariance to eliminate nuisance parameters. Large sample theory: basic convergence concepts; robustness; efficiency; contiguity, locally asymptotically normal experiments; convolution theorem; asymptotically UMP and maximin tests. Asymptotic theory of likelihood ratio and score tests. Rank permutation and randomization tests; jackknife, bootstrap, subsampling and other resampling methods. Further topics: sequential analysis, optimal experimental design, empirical processes with applications to statistics, Edgeworth expansions, density estimation, time series.

*2-4 units, A: Aut, B: Win (Romano, J), C: Spr (Siegmond, D)*

**STATS 305. Introduction to Statistical Modeling**—The linear model: simple linear regression, polynomial regression, multiple regression, anova models; and with some extensions, orthogonal series regression, wavelets, radial basis functions, and MARS. Topics: normal theory inference (tests, confidence intervals, power), related distributions (t, chi-square, F), numerical methods (QR, SVD), model selection/regularization (Cp, AIC, BIC), diagnostics of model inadequacy, and remedies including bootstrap inference, and cross-validation. Emphasis is on problem sets involving substantial computations with data sets, including developing extensions of existing methods. Prerequisites: consent of instructor, 116, 200, applied statistics course, CS 106A, MATH 114.

*2-4 units, Aut (Owen, A)*

**STATS 306A. Methods for Applied Statistics**—Extension of modeling techniques of 305: binary and discrete response data and nonlinear least squares. Topics include regression, Poisson loglinear models, classification methods, clustering. May be repeated for credit. Prerequisite: 305 or equivalent.

*2-4 units, Win (Owen, A)*

**STATS 306B. Methods for Applied Statistics**—Unsupervised learning techniques in statistics, machine learning, and data mining.

*2-4 units, Spr (Tibshirani, R)*

**STATS 310A. Theory of Probability**—Mathematical tools: asymptotics, metric spaces; measure and integration;  $L_p$  spaces; some Hilbert spaces theory. Probability: independence, Borel-Cantelli lemmas, almost sure and  $L_p$  convergence, weak and strong laws of large numbers. Weak convergence and characteristic functions; central limit theorems; local limit theorems; Poisson convergence. Prerequisites: 116, MATH 171.

*2-4 units, Aut (Siegmond, D)*

**STATS 310B. Theory of Probability**—Stopping times, 0-1 laws, Kolmogorov consistency theorem. Uniform integrability. Radon-Nikodym theorem, branching processes, conditional expectation, discrete time martingales. Exchangeability. Large deviations. Laws of the iterated logarithm. Birkhoff's and Kingman's ergodic theorems. Recurrence, entropy. Prerequisite: 310A or MATH 230A.

*2-4 units, Win (Dembo, A)*

**STATS 310C. Theory of Probability**—Infinitely divisible laws. Continuous time martingales, random walks and Brownian motion. Invariance principle. Markov and strong Markov property. Processes with stationary independent increments. Prerequisite: 310B or MATH 230B.

*2-4 units, Spr (Lai, T)*

**STATS 314. Advanced Statistical Methods**—Topic this year is multiple hypothesis testing. The demand for new methodology for the simultaneous testing of many hypotheses as driven by modern applications in genomics, imaging, astronomy, and finance. High dimensionality: how tests of many hypotheses may be considered simultaneously. Classical techniques, and recent developments. Stepwise methods, generalized error rates such as the false discovery rate, and the role of resampling. May be repeated for credit.

*2-3 units, not given this year*

**STATS 315A,B. Modern Applied Statistics**—Three-part sequence. New techniques for predictive and descriptive learning using ideas that bridge gaps among statistics, computer science, and artificial intelligence. Emphasis is on statistical aspects of their application and integration with more standard statistical methodology. Predictive learning refers to estimating models from data with the goal of predicting future outcomes, in particular, regression and classification models. Descriptive learning is used to discover general patterns and relationships in data without a predictive goal, viewed from a statistical perspective as computer automated exploratory analysis of large complex data sets.

**A: Learning**, *2-3 units, Aut (Hastie, T)*

**B: Data Mining**, *2-3 units, Win (Friedman, J)*

**STATS 315C. Modern Applied Statistics: Transposable Data**—Topics: clustering, biclustering, and spectral clustering. Data analysis using the singular value decomposition, nonnegative decomposition, and generalizations. Plaid model, aspect model, and additive clustering. Correspondence analysis, Rasch model, and independent component analysis. Page rank, hubs, and authorities. Probabilistic latent semantic indexing. Recommender systems. Applications to genomics and information retrieval. Prerequisite: 315A,B, 305, 306A,B, or consent of instructor.

*2-3 units, Spr (Owen, A)*

**STATS 318. Modern Markov Chains**—Tools for understanding Markov chains as they arise in applications. Random walk on graphs, reversible Markov chains, Metropolis algorithm, Gibbs sampler, hybrid Monte Carlo, auxiliary variables, hit and run, Swedson-Wong algorithms, geometric theory, Poincare-Nash-Cheger-Log-Sobolov inequalities. Comparison techniques, coupling, stationary times, Harris recurrence, central limit theorems, and large deviations.

*3 units, Spr (Montanari, A)*

**STATS 319. Literature of Statistics**—Literature study of topics in statistics and probability culminating in oral and written reports. May be repeated for credit.

*1-3 units, Aut (Romano, J), Spr (Siegmond, D)*

**STATS 323. Computational Methods for Geometric Design and Imaging**—Multiresolution approximation analysis as a mathematical tool for the construction of wavelets and sub-banding coding schemes; modifications and extensions of this have contributed to the advancement in curve/surface design and image manipulation. Computational methods for geometric design and image processing. Curve and surface subdivision schemes, and computational schemes based on the anisotropic diffusion model. The diffusion framework applied to the analysis and visualization of higher dimensional data sets by introducing diffusion kernels and metrics.

*2-3 units, Spr (Lange, K)*

**STATS 327. Software for Data Analysis**—Principles and techniques for writing statistical data analysis software using the S language, specifically the R software, as the main medium. Software project. Prerequisite: experience with S.

*2-3 units, Win (Chambers, J)*

**STATS 345. Computational Molecular Biology**—Gene expression microarrays: preliminary data analysis and processing computation of expression indices, supervised and unsupervised learning methods, incorporation of information from gene ontology and biological knowledge base. Sequence analysis: alignment and search algorithms, hidden Markov models, stochastic models for sequence motifs and regulatory modules. Introduction to transcriptional regulatory network.

*2-3 units, Aut (Wong, W)*

**STATS 366. Advanced Bioinformatics**—(Same as 166, BIOMEDIN 366; see 166.)

*2-3 units, Win (Srinivasan, B)*

**STATS 374. Large Deviations**—(Same as MATH 234.) Combinatorial estimates and the method of types. Large deviation probabilities for partial sums and for empirical distributions, Cramer’s and Sanov’s theorems and their Markov extensions. Applications in statistics, information theory, and statistical mechanics. Prerequisite: MATH 230A or STATS 310.

*3 units, Win (Dembo, A)*

**STATS 377. Statistical Theory of Data Acquisition**—The bias-variance tradeoff and the role of sample size in statistical estimation and decisions. Empirical studies of the role of sample size and opportunities afforded by massive datasets. Interactive learning methods. Polling methods, consistency checking, and identification of anomalous or malicious contributions. Optimal cost methods for data gathering, labeling, and checking. Open acquisition of data and large collaborative data projects.

*1 unit, not given this year*

**STATS 390. Consulting Workshop**—Skills required of practicing statistical consultants, including exposure to statistical applications. Students participate as consultants in the department’s drop-in consulting service, analyze client data, and prepare formal written reports. Seminar provides supervised experience in short term consulting. May be repeated for credit. Prerequisites: course work in applied statistics or data analysis, and consent of instructor.

*1-3 units, Aut (Owen, A), Win (Staff), Spr (Olshen, R)*

**STATS 398. Industrial Research for Statisticians**—Doctoral research as in 298, but must be conducted for an off-campus employer. Final report required. May be repeated for credit. Prerequisite: Statistics Ph.D. candidate.

*1-9 units, Aut, Win, Spr, Sum (Staff)*

**STATS 399. Research**—Research work as distinguished from independent study of nonresearch character listed in 199. May be repeated for credit.

*1-10 units, Aut, Win, Spr, Sum (Staff)*

## COGNATE COURSES

See respective department listings for course descriptions and General Education Requirements (GER) information. See degree requirements above or the program’s student services office for applicability of these courses to a major or minor program.

**APPPHYS 214. Randomness in the Physical World**

*3 units, not given this year*

**EE 376A. Information Theory**

*3 units, Win (Weissman, I)*

**EE 376B. Information Theory**

*3 units, not given this year*

**MATH 236. Introduction to Stochastic Differential Equations**

*3 units, Win (Papanicolaou, G)*

## OVERSEAS STUDIES

Courses taught overseas can be found in the “Overseas Studies” section of this bulletin, or in the Overseas Studies office, 126 Sweet Hall.

### PARIS

**STATS 30. Statistical Thinking**

*3 units, Aut (Switzer, P)*

**STATS 99. Paris by Numbers**

*2-4 units, Aut (Switzer, P)*
