The Center for Probing the Nanoscale has partnered with the Papalote – Museo Del Niño, located in Mexico City, to develop hands-on activities that engage visitors in learning about advanced nanoprobe techniques. The existing CPN nanoprobe models were made available to the museum to be used during a special event to introduce visitors to nanoscience and nanotechnology. CPN and Papalote staff produced a Spanish version of the nanoprobe activity station, which was employed during the museum’s hosting of NanoDays and a special career event. Overall, more than 5,000 visitors to the museum got engaged with the nanoprobe activity station.
