

Policy Measures for Reducing Greenhouse Gas Emissions from Heavy- Duty Vehicles: California, the US, and the World

Ben Sharpe, PhD

Sustainable Transportation Seminar
The Precourt Energy Efficiency Center
Stanford University
October 4, 2013

Topics

- Background and overview of policy measures in increase heavy-duty vehicle (HDV) efficiency
- Regulatory timelines across countries/regions
- Voluntary 'green freight' programs
- Regulatory design summaries and considerations for next phases of fuel efficiency and GHG regulations
 - California
 - US and Canada
 - Japan
 - China
 - European Union
- Summary remarks

The International Council on Clean Transportation

- The mission of the ICCT is to dramatically improve the environmental performance and efficiency of onroad vehicles, aircraft, and marine vessels in order to protect public health, the environment, and quality of life
- Full-time staff of roughly 40
- Staff are natives of 10 countries and speak more than a dozen languages
- Offices in San Francisco, Washington DC, Berlin

Background: HDV CO₂ Emissions

- Heavy-duty vehicles are a major, growing energy demand and CO₂ source
- Policies for light-duty are well underway, but policies for HDVs are in early phases

Global Transport Emissions

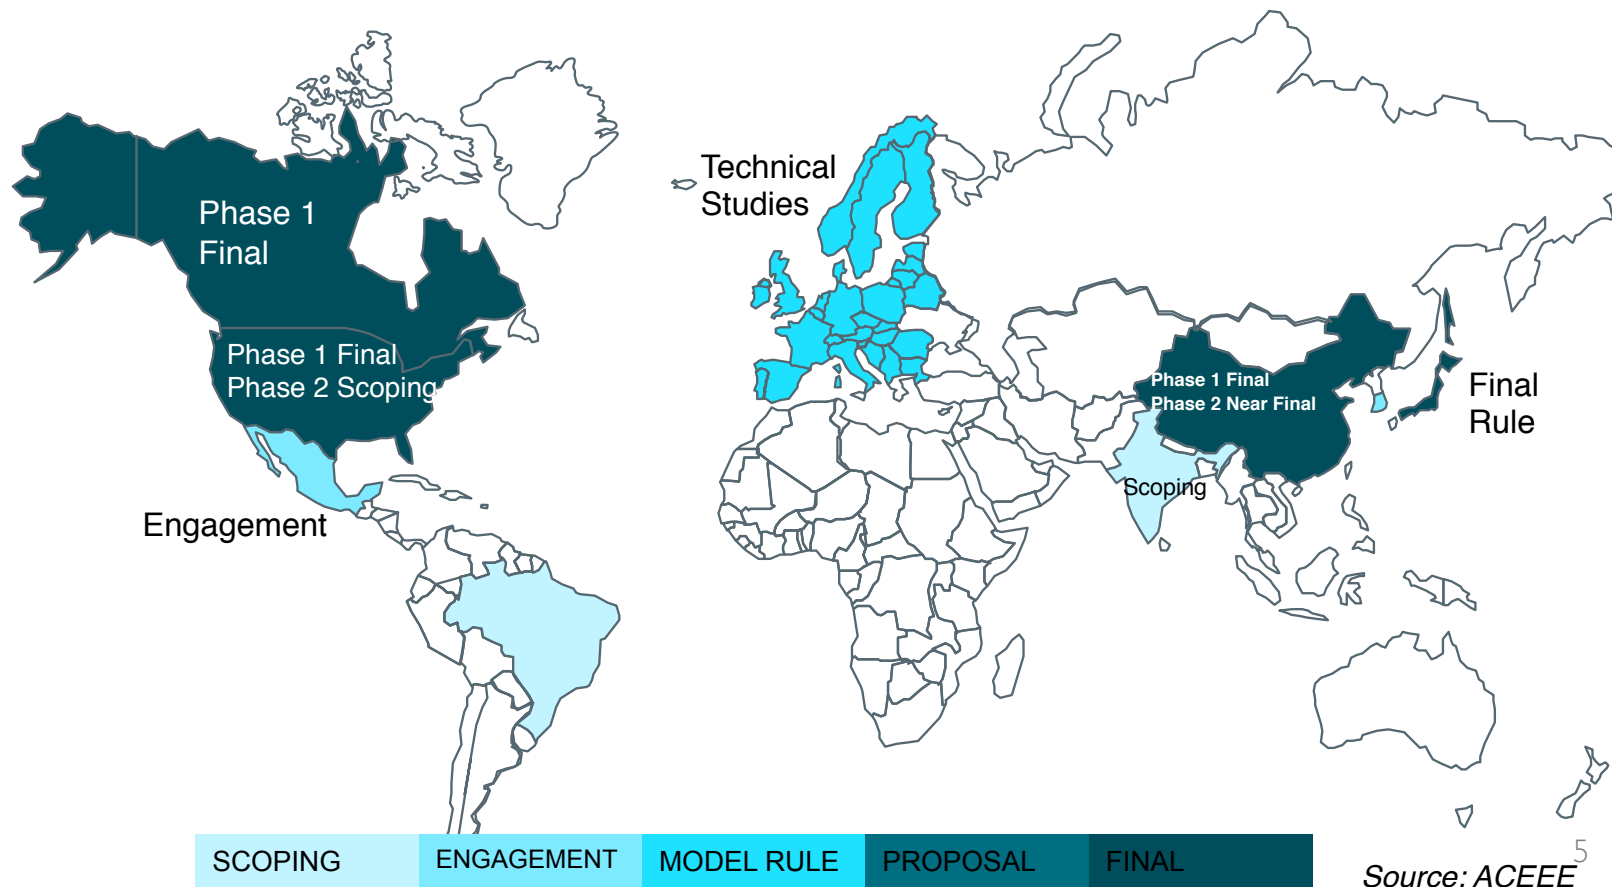

Source: ICCT Roadmap Model, 2013

Integrated Vehicle Efficiency Policy Portfolio

 Today's presentation	VEHICLE FUEL EFFICIENCY STANDARDS	<ul style="list-style-type: none">• Introduce and regularly strengthen mandatory standards• Establish and harmonize testing procedures for fuel efficiency measurement.
	FISCAL MEASURES	<ul style="list-style-type: none">• Fuel taxes and vehicle taxes to encourage the purchase of more fuel-efficient vehicles.• Infrastructure support and incentive schemes for very fuel-efficient vehicles.
	MARKET-BASED APPROACHES	<ul style="list-style-type: none">• Voluntary programs such as U.S. SmartWay and other green freight programs
	INFORMATION MEASURES	<ul style="list-style-type: none">• Vehicle fuel economy labels• Improving vehicle operational efficiency through eco-driving and other measures.

Heavy-Duty GHG Regulation Status

- HDV efficiency standards being considered at some minimal level – represents over 80% of global HDV population

HDV global regulatory landscape

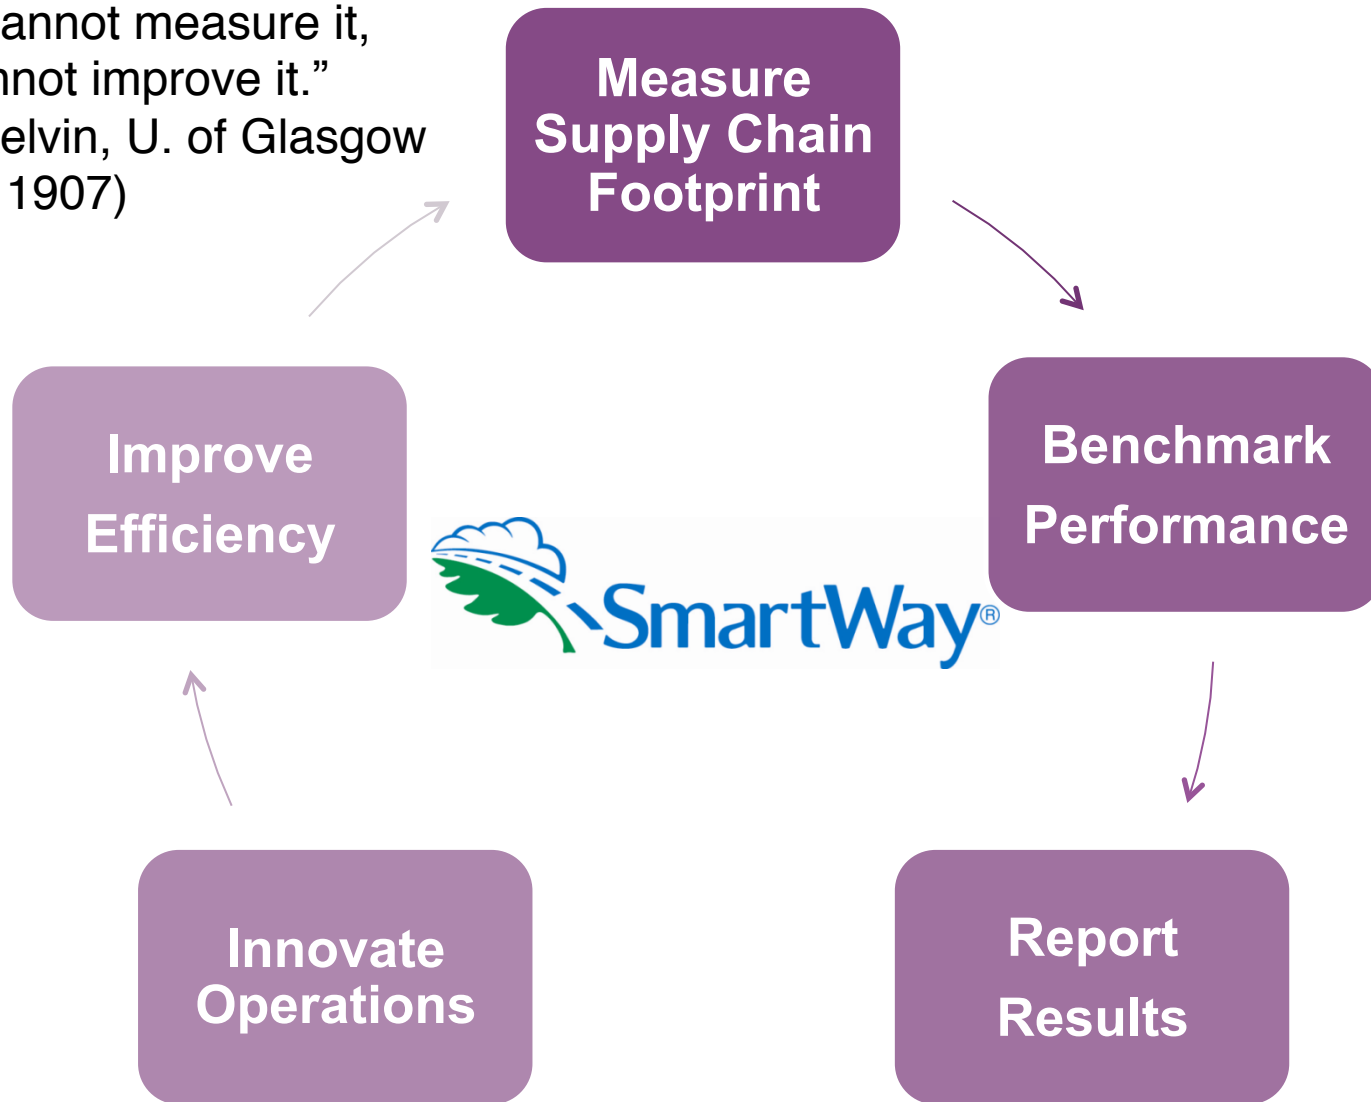

Country/Region	Regulation Type	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	
Japan	Fuel economy	Phase 1 regulation implemented starting MY 2015											
United States	GHG/Fuel efficiency	Standard proposal	Final rule					Regulation implemented starting MY 2014 (mandatory DOT program starts MY 2016)					Phase 2 implementation
China	Fuel consumption	Test procedure finalized	Industry standard proposal	Industry standard implemented	National standard adopted			Regulation implemented starting MY 2015					
European Union	CO ₂ test procedure	Technical studies				Impact assessment/ Test procedure finalized				Policy implementation			
Canada	GHG/Fuel efficiency			Standard proposal	Final rule			Regulation implemented starting MY 2014				Phase 2	
Korea	Fuel efficiency	Technical studies				Impact assessment	Test procedure finalized		Policy implementation (second half of 2015)				
Mexico	Fuel efficiency				Proposal			Regulation implemented starting MY 2016				Phase 2 implementation	
California	End-user purchase requirements	Requirements for new tractors, trailers (2011+)				Additional reqs. for existing tractors and trailers (<MY 2010)		Additional reqts. for existing trailers and reefers (<MY 2010)					

Voluntary, Public-Private Partnership Programs

- Over the past decade a number of voluntary programs have been implemented to improve the environmental performance and efficiency of the goods movement sector
- First program: US EPA's SmartWay Transport Partnership began in 2004 (<http://www.epa.gov/smartway/>)
- SmartWay has grown from roughly a dozen charter companies to over 3,000 partner companies and affiliates
 - Roughly 1/3rd of all trucking miles in the US are done by SmartWay members
- SmartWay as a model for other countries/regions
 - SmartWay in Canada
<http://oee.nrcan.gc.ca/transportation/business/smartway/18053>
 - China Green Freight Initiative
<http://www.greenfreightandlogistics.org/programs/green-freight-china-program-2/>
 - Green Freight Europe
<http://www.greenfreighteurope.eu/>
 - Transporte Limpio (Mexico)
<http://www.transportelimpio.gob.mx/>

How SmartWay Works

“If you cannot measure it,
you cannot improve it.”
- Lord Kelvin, U. of Glasgow
(1824 – 1907)

SmartWay Trucking Company Performance Data

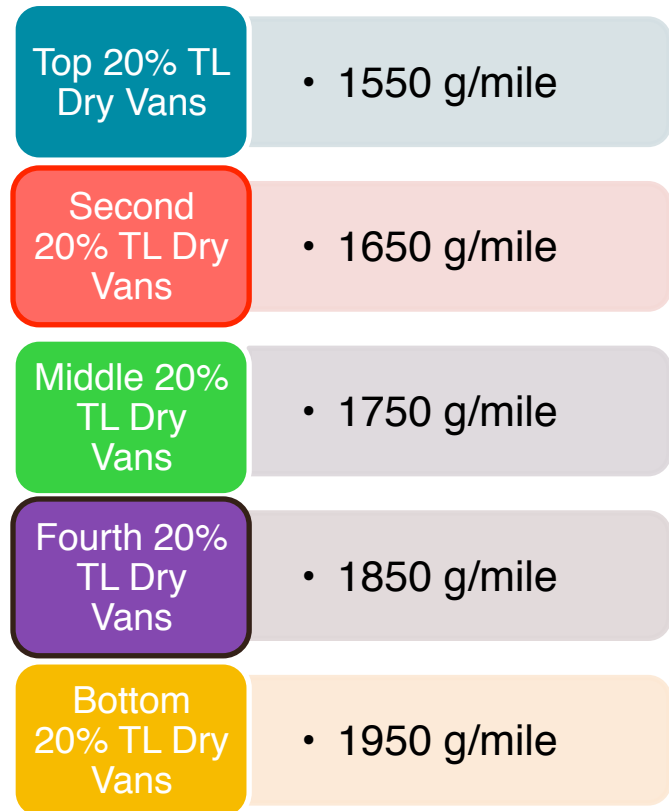

Empowering shippers with information about trucking company performance

15 Carrier Categories
- (TL, LTL, Refrigerated, Tanker, etc.)
8 Emission Metrics

SmartWay Carrier Rating Pollutant Specific Performance Levels

Quintile Rankings (ex: Truckload CO₂ g/mile)

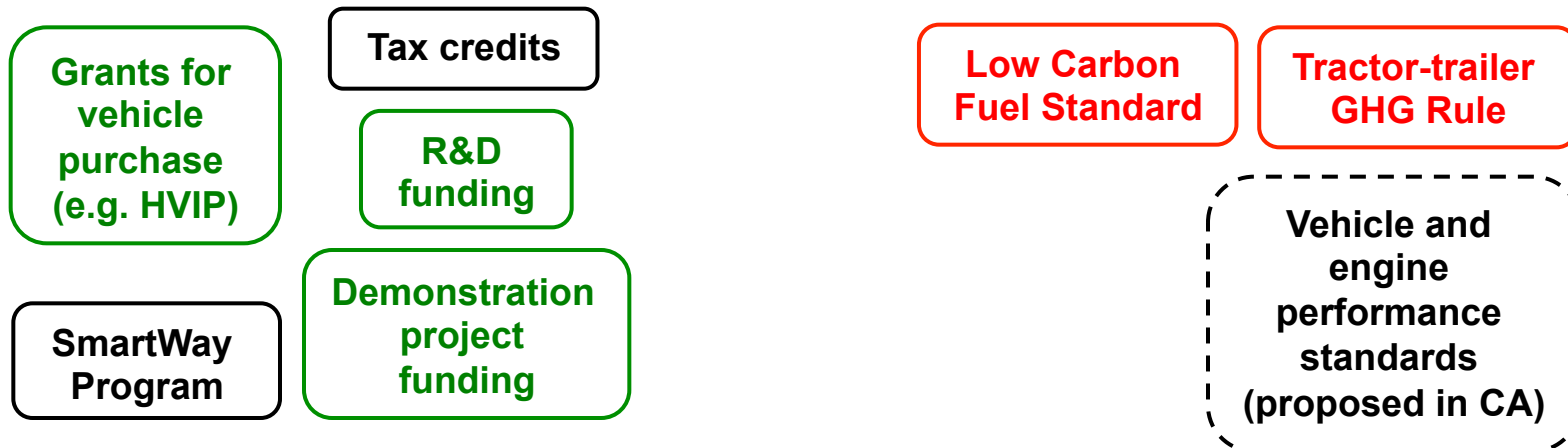

Policies Affecting Heavy-Duty Vehicles in California

Criteria Pollutant-Focused Measures

Greenhouse Gas-Focused Measures

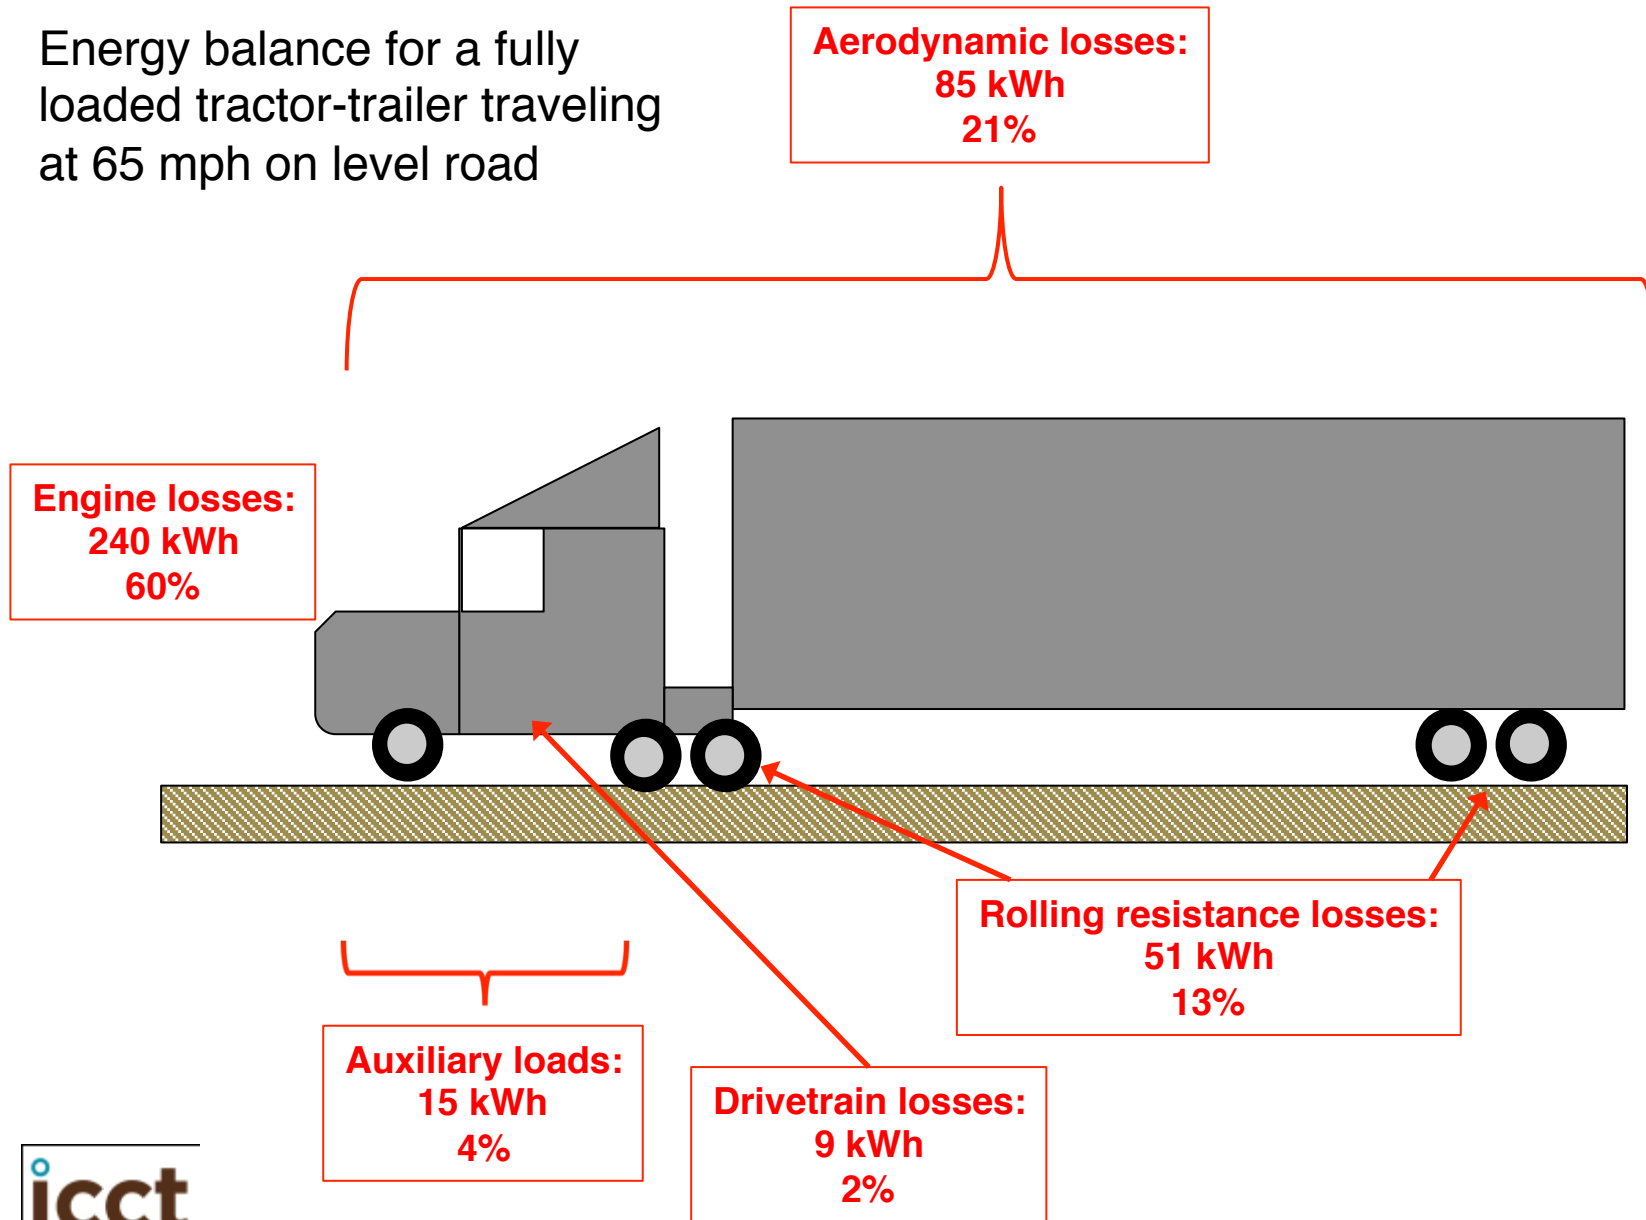

- Incentive-based policy in California
- Regulatory program in California

- Policy administered at the federal level
- CA and US policy harmonized

California's Tractor-Trailer GHG Rule: Context

Energy balance for a fully loaded tractor-trailer traveling at 65 mph on level road

California's Tractor-Trailer GHG Rule: Overview

- Goal: Reduce Greenhouse Gas (GHG) emissions from long-haul tractors by improving tractor and trailer aerodynamics and tire rolling resistance
- Based on elements of US EPA SmartWay Program
- Applies to: 53-foot box-type trailers and heavy-duty (HD) tractors that pull them on California highways
- Implementation began 2010
- Responsible for compliance: owners, drivers, motor carriers, California-based brokers, California-based shippers

Tractor-Trailer GHG Rule: Tractor Requirements

- 2011+ model year sleeper cabs:
 - *SmartWay* certified beginning January 1, 2010
- 2011+ model year day cabs:
 - *SmartWay* verified low rolling resistance (LRR) tires (1.5% fuel efficiency improvement) certified beginning January 1, 2010
- Pre-2011 model year sleeper & day cabs:
 - *SmartWay* verified LRR tires beginning January 1, 2013

Tractor-Trailer GHG Rule: Trailer Requirements

- 53-foot box type trailers → *SmartWay* certified or retrofitted with *SmartWay* verified technologies, including:
 - LRR tires (1.5% fuel efficiency improvement), and
 - Aerodynamic technologies that provide,
 - 5% fuel efficiency improvement for dry vans
 - 4% fuel efficiency improvement for refrigerated vans
- Compliance deadlines:
 - 2011+ model year (new) trailers: January 1, 2010 for aero and tires
 - Pre-2011 model year trailers
 - Aerodynamic technologies by January 1, 2013 or choose a delayed compliance option 2012-2016
 - LRR tires by January 1, 2017

Tractor-Trailer GHG Rule: Fleets Going Beyond!

Some fleets seeing fuel savings > 10%

California's Long-Term Vision for GHG Reductions

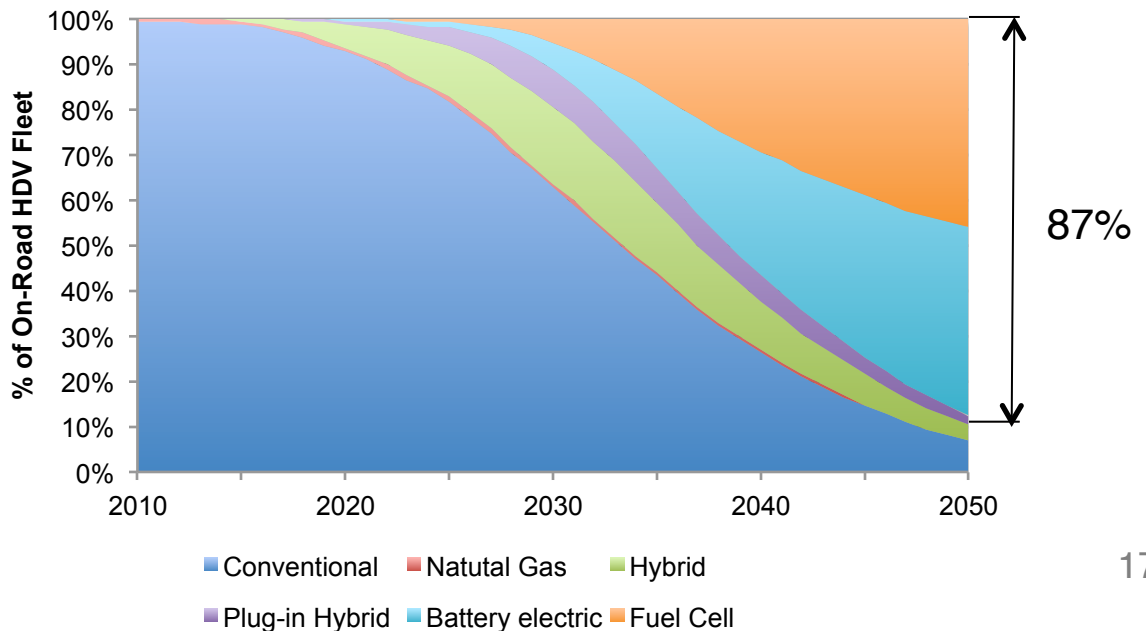

Source: California Air Resources Board

Achieving 80% reduction in GHGs from the on-road transportation sector by 2050 requires wide-scale adoption of zero-emission vehicles → **BOTH** in light- and heavy-duty vehicles

Zero emission solutions are in their infancy for HDVs. Significant technological progress and cost reductions are required!
→ **Especially for long-haul trucking**

Source: Ben Sharpe's Dissertation Research

US FE/GHG Phase 1 Program: Background

- Rule finalized in August 2011 → Implementation starts in model year 2014
- Two distinct but nearly identical programs:
 - EPA has authority to regulate GHGs under the Clean Air Act
 - National Highway Traffic Safety Admin. (NHTSA) has authority to regulate fuel efficiency under the Energy Independence and Security Act
- EPA program will regulate CO₂, CH₄, N₂O, and HFCs (refrigerant)
- EPA and NHTSA programs are identical in terms of fuel use/CO₂
 - Only real difference between the two programs is that the EPA's includes CH₄, N₂O, and HFCs
- EPA program starts in model year (MY) 2014, NHTSA: MY2016
 - In reality, manufacturers will only have to “worry” about meeting the EPA regulation

US FE/GHG Phase 1 Program: Stringency

- Largely relies on promoting “off-the-shelf” technologies
- Regulation can be thought of as 3 distinct programs

Class 7/8 Tractors

10-23%

12-17%

Class 2B/3 Pickup Trucks and Vans

Everything Else = “Vocational Vehicles”

6-9%

Class 7 and 8 Tractor Program

Engines subject to their own standard

Fuel
CO₂
CH₄
N₂O

Unique vehicle characteristics:
aerodynamics, rolling resistance,
weight reduction, idle reduction,
speed limiter

Greenhouse gas Emissions Model (GEM) v1.0

Regulatory Class

- Class 8 Combination - Sleeper Cab - High Roof
- Class 8 Combination - Sleeper Cab - Mid Roof
- Class 8 Combination - Sleeper Cab - Low Roof
- Class 8 Combination - Day Cab - High Roof
- Class 8 Combination - Day Cab - Low/Mid Roof
- Class 7 Combination - Day Cab - High Roof
- Class 7 Combination - Day Cab - Low/Mid Roof
- Heavy Heavy-Duty - Vocational Truck (Class 8)
- Medium Heavy-Duty - Vocational Truck (Class 6-7)
- Light Heavy-Duty - Vocational Truck (Class 2b-5)

Simulation Inputs

Coefficient of Aerodynamic Drag:
Steer Tire Rolling Resistance (kg/metric ton):
Drive Tire Rolling Resistance (kg/metric ton):
Vehicle Speed Limiter (mph):
Vehicle Weight Reduction (lbs):
Extended Idle Reduction (g CO₂/ton-mile):

RUN

Full vehicle is certified using the GEM vehicle simulation tool

Class 2B and 3 Pickup Trucks and Vans Program

Chassis dynamometer testing

- Meant to mirror the light-duty testing program
- Main difference from LD program: vehicles are certified based on their “work factor” (WF)

$$WF = [0.75 \times (\text{Payload Capacity} + \text{xwd})] + [0.25 \times \text{Towing Capacity}]$$

where

$$\text{Payload Capacity} = \text{GVWR (lbs)} - \text{Curb Weight (lbs)}$$

xwd = 500 if the vehicle is equipped with 4-wheel drive and 0 otherwise

Key Opportunities for Improvement in US Phase 2

Integrating transmissions into the testing protocols

Source: Oak Ridge National Lab

- Recognizing interactions btw engine and transmission
- Properly evaluating HD hybrid systems

- 5-10% fuel savings available from trailer aero and RR improvements
- Opportunity to build on success of SmartWay program

Including trailers

Trailer Regulatory Challenges

- Trailer market diversity
- Approximately 2 or 2.5 trailers for every tractors
- Split incentive: owner of trailer often does not operate trailer, thus has little incentive to invest in fuel-saving technologies
- Large number of small businesses in trailer manufacturing

Japan: Fuel Economy Program Summary

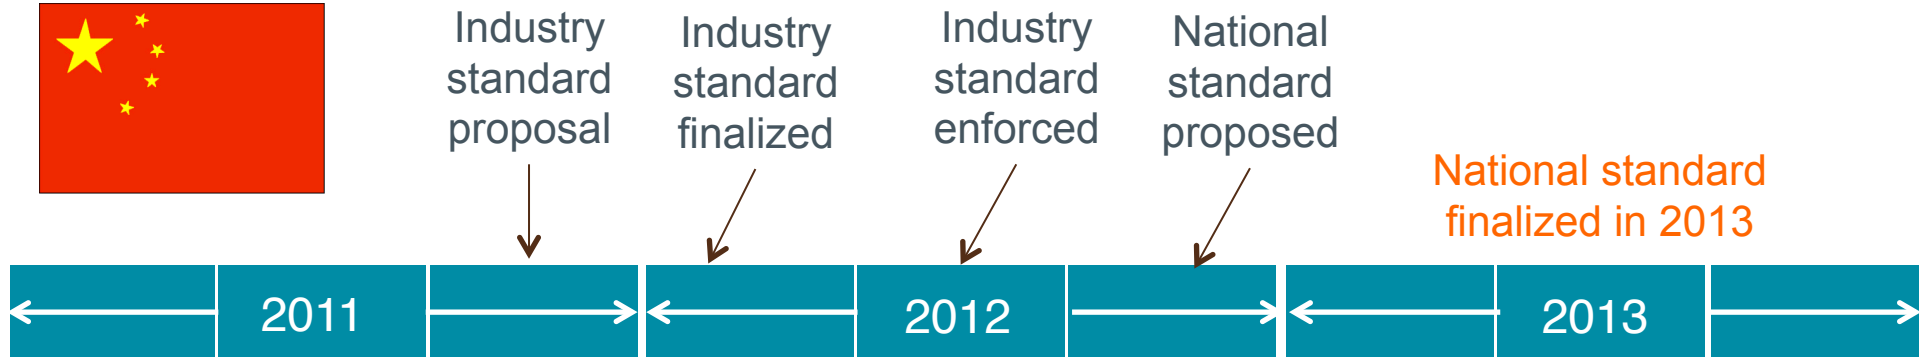

2006: Japan introduced the world's first fuel economy standard for HDVs

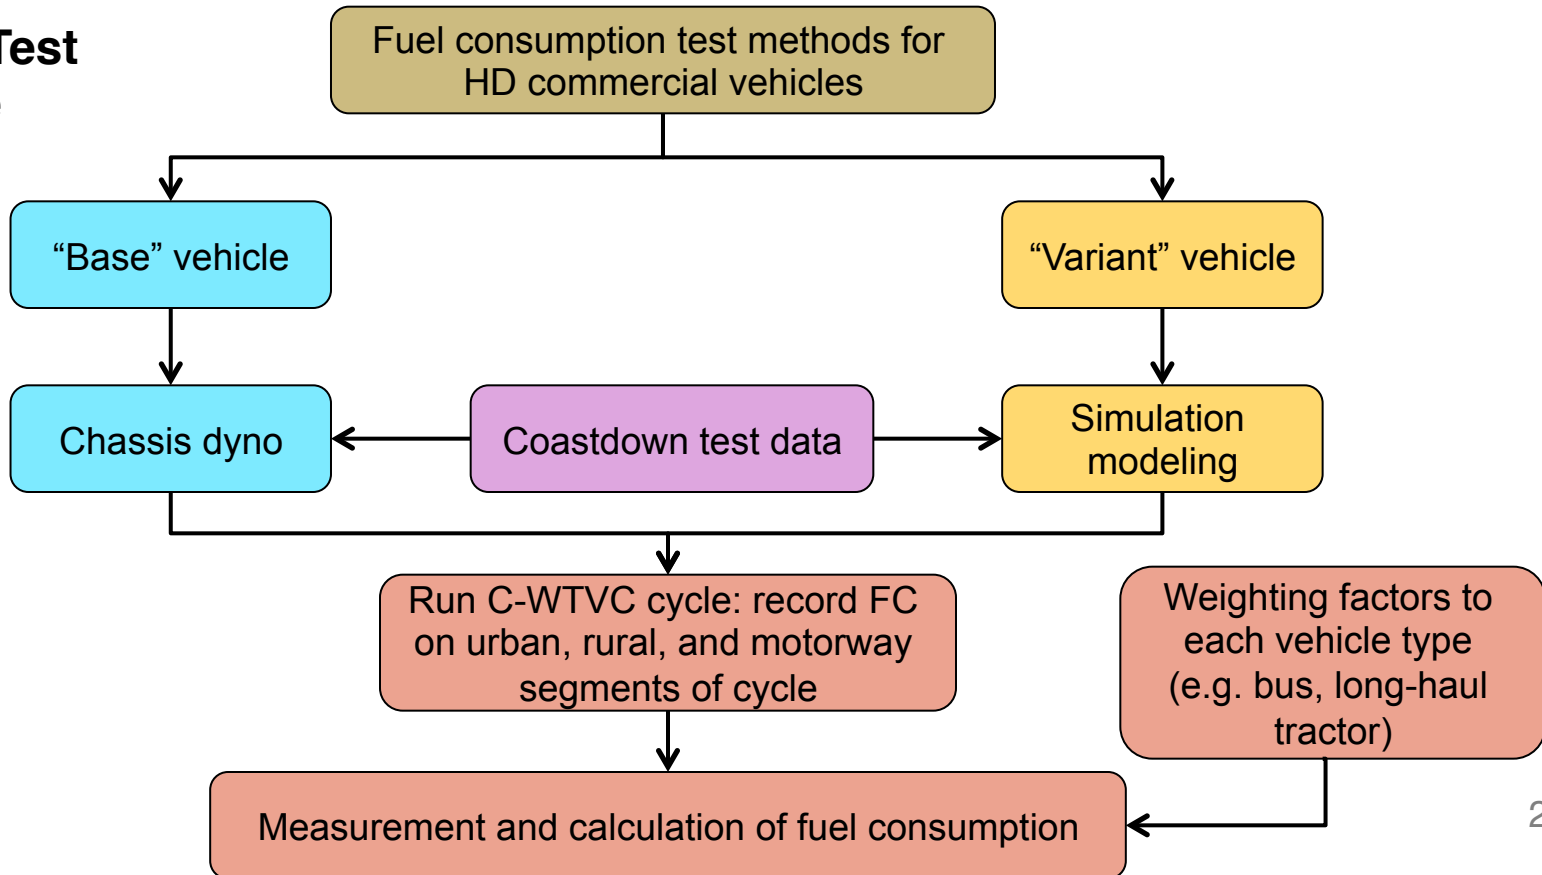

- Vehicles included
 - Commercial vehicles with gross vehicle weight rating (GVWR) > 3.5 metric tons, buses with carrying capacity > 11 people
- Targets (km/l) disaggregated by vehicle type, class, and weight
- Most efficient vehicle (“top runner”) in MY 2002 set as baseline
 - Hybrid vehicles were excluded when determining the top runner
- Manufacturers must meet targets starting in MY 2015
- Roughly 10-13% FE improvement required vs. 2002 Top Runner baseline → improvements primarily from engines

- Phase 2 developments currently under way → target year 2025
- Expected completion timeframe: 2014/2015

China: Fuel Consumption Program Summary

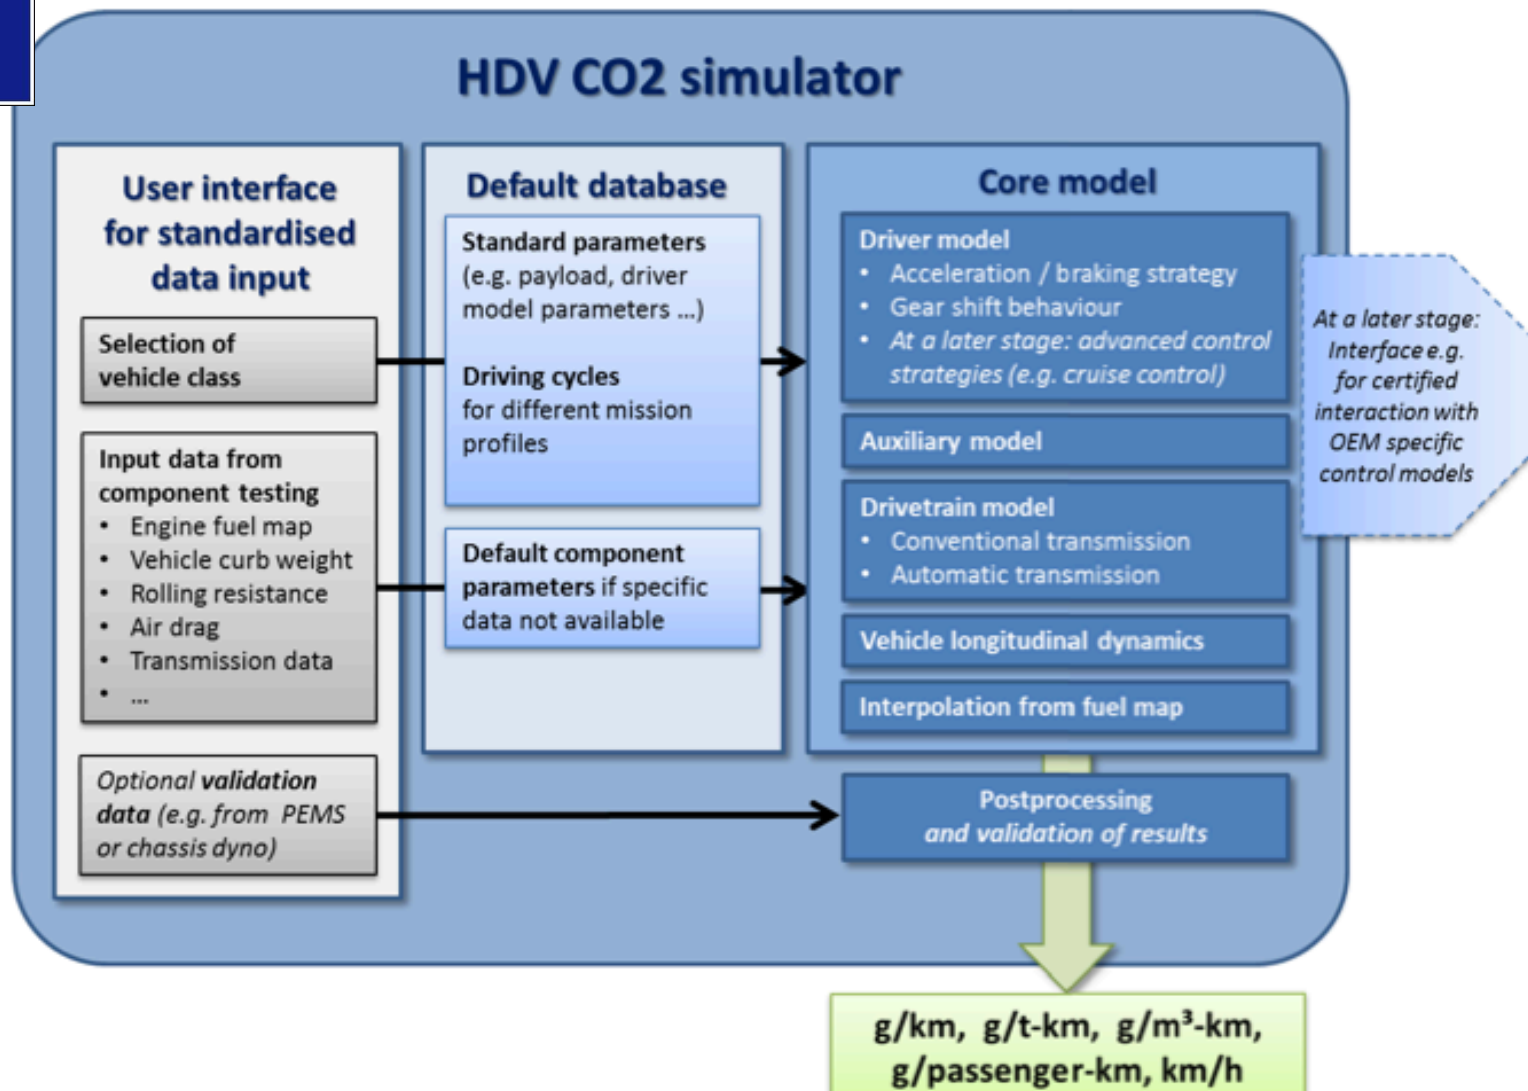

Finalized Test Procedure

China: Industry vs. National Standard

- Industry Standard (Stage 1)
 - Proposed in 2011 and adopted in Dec 31, 2011
 - New models must meet standard starting July 1, 2012; existing models July 1, 2014
 - Standard is set at the 90th percentile of the baseline
 - Goal: Phasing out most inefficient and chance to collect further data
 - Based on 300+ vehicles tested
- National Standard (Stage 2)
 - Proposed September 2012
 - New models must meet standards starting from July 1, 2014; existing models by July 1, 2015
 - Tightens Industry standard ~10-15%, almost 50% of vehicles tested did not meet limits. (based on further testing)

Developments in the European Union

New Developments in the EU

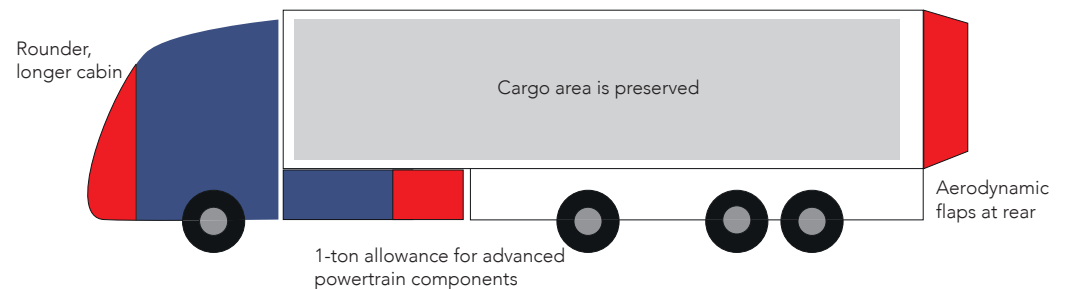

- Truck shape – cab over engine
 - Due to length restrictions of total truck (not just trailer as in US)
 - New proposal to allow for more aerodynamic tractor/trailers

- For new trucks ~2018-2020
 - Previous weight/length limit – 40 metric tons/61.5 feet
 - New limits allow for increased weight to accommodate hybrid powertrain and increased length to accommodate aerodynamic design
 - Estimate 7-10% reduction in GHG emissions from long haul trucks

HDVs with current regulations

HDVs with proposed regulations

Conclusions

- It is an important period for heavy-duty vehicle GHG / fuel economy policy – worldwide
- Both voluntary and mandatory policy measures have an important role to play
- Incorporation of major technologies is important for standards
 - Transmission technologies
 - Hybrid technology
 - Tires, aerodynamics, lightweighting
 - Trailers

Extra Slides

US Technology Assessment

- National Academy of Sciences Report (March 2010) found 35 – 50% improvement could be achieved in the 2015 to 2020 timeframe

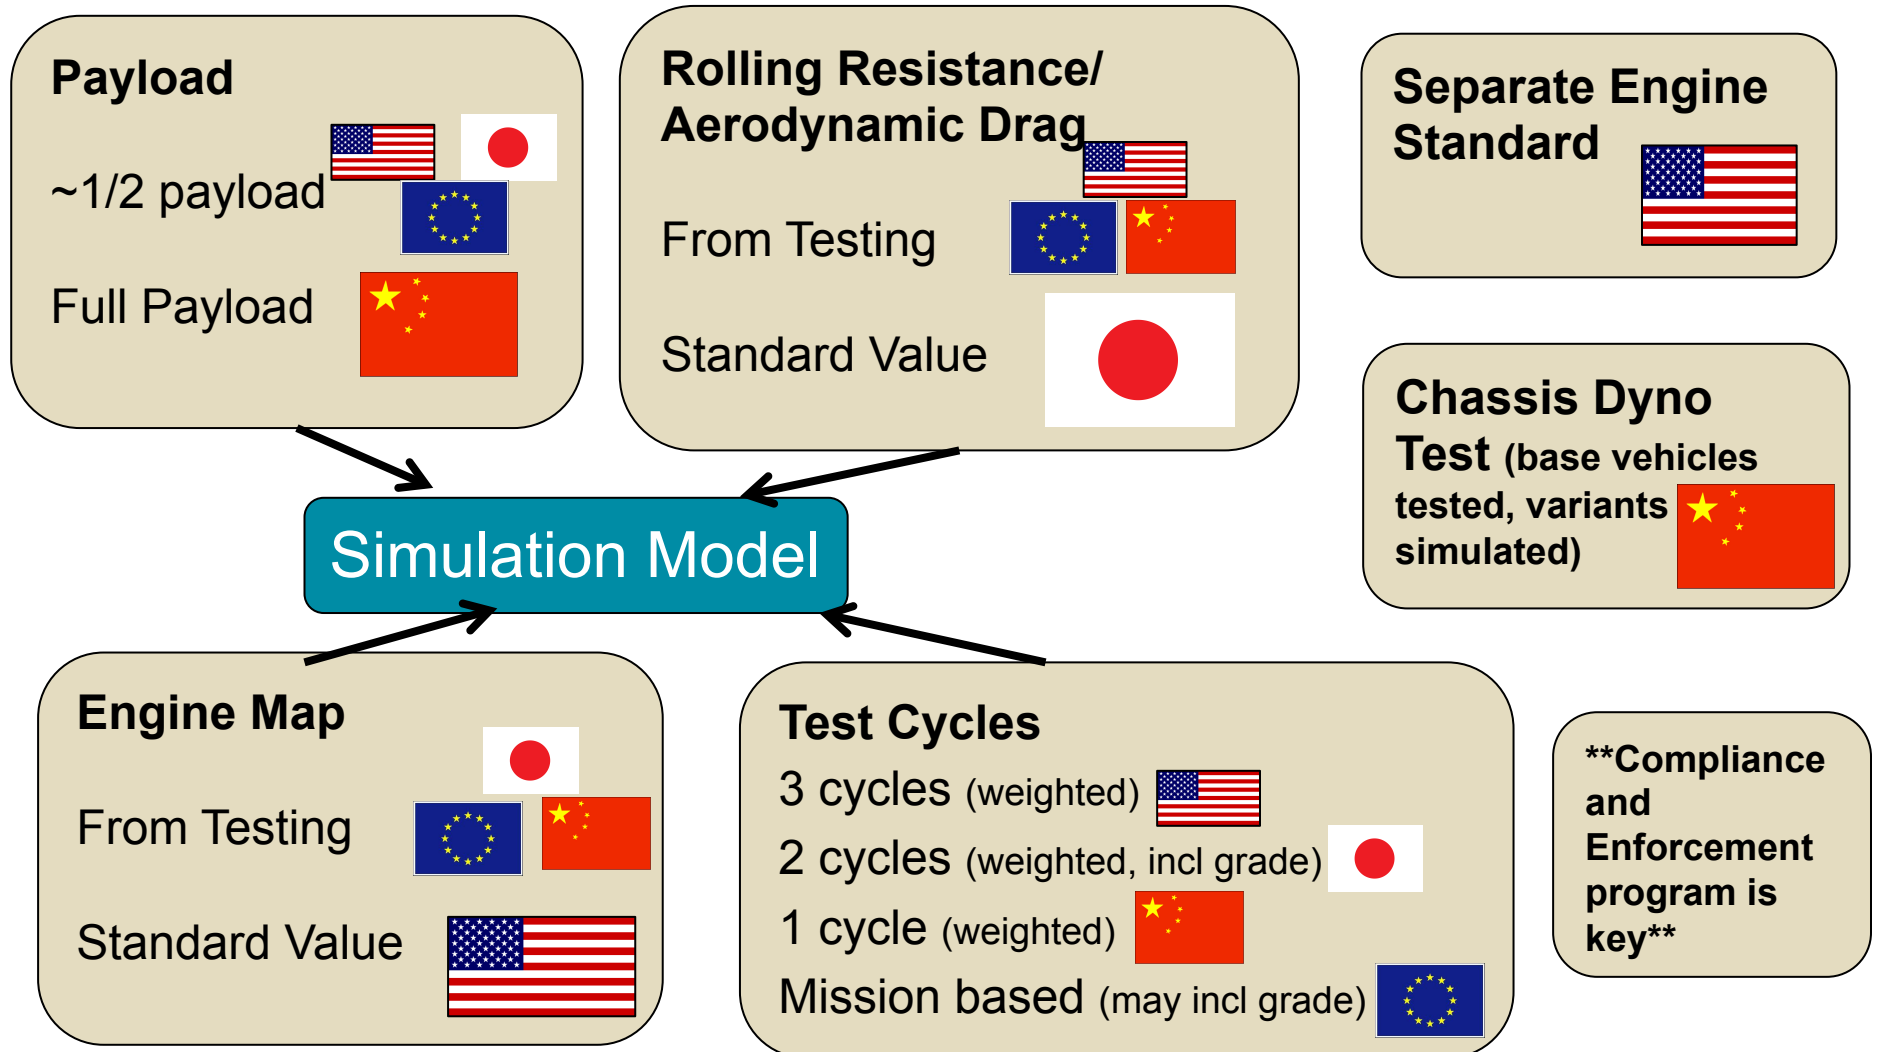

National Academy of Sciences (2010) FIGURE S-1 Comparison of 2015-2020 New Vehicle Potential Fuel Savings Technology for Seven Vehicle Types: Tractor Trailer (TT), Class 3-6 Box (Box), Class 3-6 Bucket (Bucket), Class 8 Refuse (Refuse), Transit Bus (Bus), Motor Coach (Coach), and Class 2b Pickups and Vans (2b). Also, for each vehicle class, the fuel consumption benefit of the combined technology packages is calculated as follows: $\%FC_{package} = 1 - (1 - \%FC_{tech1})(1 - \%FC_{tech2})(1 - \%FC_{techN})$ where $\%FC_{tech x}$ is the percent benefit of an individual technology. SOURCE: TIAx (2009) ES-4.

Regulatory Design Summary

	Regulatory Categories	Certification Test Procedures	Metric		
Japan	Other Truck (11 subcategories) Tractor (2 subcategories) Route Bus (5 subcategories) Other Bus (8 subcategories)	Simulation modeling + engine dynamometer testing	Fuel economy (km/L)		
N. America	Tractors Vocational vehicles HD pickup trucks and vans Engines (tractors, voc. vehicles)	Vehicles → simulation model Engines → dynamometer testing	Tractors, Vocational	HD Pickups	Engines
			gal/1,000 ton-mi	gal/100 mi	gal/100 bhp-hr
			g/ton-mi	g/mi	g/kWh
China*	Tractors, dump trucks, rigid trucks, city buses, other buses	“Base” vehicles → chassis dynamometer “Variant” vehicles → simulation modeling	Fuel consumption (L/100 km)		
European Union*	Truck and bus categories based on GVWR, chassis configuration, and axle configuration	Simulation modeling	GHG (g/tonne-km)		

Test Procedure Comparison

Technical Potential Globally

- Different technologies have different value in different conditions
 - Approximate differences, compared to value in US context

Technology	US*	Basis for Reduction	Japan	China	EU
Engine	20%	Advanced 11-15L diesel with bottoming cycle		More	
Aerodynamics	11.5%	Improved SmartWay tractor + three aerodynamic trailers	Less	Less	Less
Tires and Wheels	11%	Improved WBS on tractor + three trailers		More	Less
Hybrid/Idle Reduction	10%	Mild parallel hybrid with idle reduction	More		Less
Transmission	7%	AMT, reduced driveline friction			
Management and Coaching/ Speed limits	6%	60 mph speed limit; predictive cruise control with telematics; driver training	Less	Less	Less
Weight	1.25%	Material substitution—2,500 lb.		More	

* These are based on NAS tractor-trailer Class 8 for US context; reductions are approximate, and are not additive

Efficiency Improvements Promoted by Regulation

	Japan	U.S. and Canada*	China	EU #
Engine	Yes	Through separate engine standards	Yes	Yes
Transmission	Somewhat	Optional; by demonstration outside of standard protocol	Yes	Yes
Hybridization	Unclear	By demonstration outside of standard protocol	Yes	Yes
Aerodynamic drag, rolling resistance	No	Yes	Yes**	Yes
Trailer	No	No	No	No

* *Potentially Mexico as well*

** *Option to use default values*

Refers to ongoing government research and testing protocols; No standards in place
