- Summary and challenges to the industry

Vision and Motivation of AISC-SHM

The AISC – SHM is an international team comprising industry, government and academic participants with a collective vision to **efficiently and effectively implement structural health monitoring** for a wide variety of commercial and military aerospace applications **through the development of guidelines, procedures, processes and standards** for implementation and certification of the technologies.

The AISC-SHM operates as a Technical Committee within SAE Aerospace (an SAE International Group) within the Aerospace Division (G-11 SHM)

Provenance

- 3rd EWSHM 2006 in Granada: Call from industry for an international '*community of practice*'
- Professor Fu-Kuo Chang, Stanford University launches AISC-SHM in Stanford, Sept 2006
- Commercial Aviation Working Group formed – 2007
- Military Aerospace working group formed - 2008
- AISC-SHM joins SAE Aerospace as a new technical document committee – 2008
- First meeting as an SAE Committee (G-11 SHM), - London Jan 2009

Provenance

- Granada 3rd EWSHM Conference on the Mechanics of Structures
- international 'committee' on the Mechanics of Structures
- Professor Fu-Kuo Chang, AISC-SHM in Stanford
- Commercial Aviation
- Military Aerospace
- AISC-SHM joins SAE International document committee
- First meeting as a SAE document committee in 2009

Stanford 2006

The committee focus is development of aerospace industry guidelines for structural health monitoring to achieve:

- Cross industry consensus on SHM implementation issues.
- Basis for SHM systems certification by providing the necessary guidelines (e.g. SAE ARP).
- Identification of technology gaps.
- Interface with other activities pertaining to aeronautical SHM
- Collective view among various organizations such as:
 - OEMs: aircraft manufacturers
 - Regulatory Authorities
 - System Integrators
 - Developers / Research organizations
 - Operators and their representatives

Univ. of Tokyo

AISC-SHM mission

- The mission of the AISC-SHM is to provide an approach for standardizing integration and certification requirements for SHM of aerospace structures, which will include system maturation, maintenance, supportability, upgrades and expansion. The goal is to develop a guidebook specifying approaches for SHM usage on Air and Space vehicles and to identify technology gaps leading to SHM utilization.

Organization and Responsibilities

AISC-SHM:

AISC -SHM

**Aerospace Industry Steering Committee for Structural Health Monitoring
Committee structure**

AISC-SHM Main Technical Committee .

Operators / end users, Regulatory agencies, OEMs, Systems integrators and SHM Suppliers, Research organisations / institutions, other interested parties

AISC-SHM Executive Management Board (EMB)

Officers, industry/ institutional representatives, chairs of working groups, plus SAE representative.

ATA interaction

SAE Administration

Working Groups

CAWG

SAE SHM Guidebook task

MAWG

Future groups

CAWG – Commercial Aviation Working Group

MAWG – Military Aviation Working Group

Current Chairmen:

AISC-SHM – Peter Foote, BAE Systems
CAWG and SAE Document sponsor: Grant Gordon, Honeywell
MAWG: Mark Derriso – US Air Force

The committee is also known as G-11 SHM within the SAE International Aerospace Division

Creation of an SAE International, Aerospace Recommended Practices Document on the implementation of SHM for aerospace.

 AEROSPACE RECOMMENDED PRACTICE	ARPxxxx
	Issued _____ Proposed Draft (Date) (OrigDate)
Guidance on Structural Health Monitoring for Aerospace Applications	

RATIONALE

The development of Structural Health Monitoring (SHM) technologies to achieve Structural Health Management (SHM) objectives in aerospace applications is an activity that spans multiple engineering disciplines. It is also recognized that many stakeholders: Regulatory Agencies, Airlines, OEM's, Academia and equipment suppliers are crucial to the process of certifying viable SHM solutions. Thus common language, framework and recommended practices are needed to promote fruitful and efficient technology development.

TABLE OF CONTENTS

1.	SCOPE
1.1	Purpose
1.2	Field of Application
2.	APPLICABLE DOCUMENTS
2.1	SAE Publications
2.2	FAA Publications
2.3	EASA Publications
2.4	TCCA Pubs
2.5	RTCA Publications
2.6	ATA Publications
2.7	U.S. Government Publications
2.8	Other Publications
2.9	Definitions
2.10	Acronyms
3.	BACKGROUND
3.1	History of Health Management
3.2	Vehicle Health Monitoring
3.3	Integrated Vehicle Health Management
4.	INTRODUCTION TO SHM SYSTEMS
4.1	Operational approaches
4.2	Functional elements
4.3	Modes of operation
5.	FIELD OF APPLICATION
5.1	Airframe Design principals
5.2	Maintenance processes
5.2.1	Maintenance processes without SHM

Target pub.date: 2012

SAE	ARPXXXX
5.2.2	Maintenance processes with SHM
5.3	Current tools for maintaining structural integrity
6.	SHM SYSTEM REQUIREMENTS
6.1	Detection capability
6.2	Durability, reliability, survivability
6.3	Fabrication / implementation / installation
6.4	Integration
6.5	Usage
6.6	Repairability/maintainability
6.7	Data Integrity and quality
6.8	Data Availability
6.9	Validation and calibration
6.10	Self diagnostic capabilities
6.11	OSA-CBM (Open-System-Architecture / Condition Based Monitoring)
	SHM QUALIFICATION
	Objectives
	Methods/Approaches/tools
	VERIFICATION/VALIDATION
	Objectives
	Methods/Approaches/tools
9.	CERTIFICATION (Civilian)
9.1	Applicable Regulations & requirements
9.2	Alternative means of compliance
9.3	Process
9.4	Methods/ tools
9.5	Certification of on-board equipment
9.6	Certification for maintenance credits procedure
9.7	Certification for use in structural design
10.	CERTIFICATION (Military)
10.1	Applicable Regulations & requirements
10.2	Additional certification considerations

Guidelines contents

- Scope (air vehicle, air frame, structural components)
 - Applicable documents (existing standards, related guidelines etc)
 - Background (context of SHM in aircraft support processes and structural design philosophies, overview of technologies)
 - Introduction to SHM systems. (Functional elements of structural health management systems based on condition and usage monitoring techniques)
 - Fields of application (How SHM can be used, intended function, concepts of operation)
 - SHM system requirements (What must SHM systems and techniques do)
 - Qualification
 - V&V
 - Certification
- } How to assure that chosen SHM solutions meet functional, operational and regulatory requirements
- Military annex (differentiation of military and civil implementation)

Division of effort

Team (alphabetic): Airbus (EADS), AFRL,BAE Systems, Boeing, Bombardier, Embraer
FHI, Hahn Spring, Honeywell, NASA, NAVSEA, RIMCOF, Sandia, Stanford Uni., Univ. of Tokyo

Section	Lead
Scope	Boeing
Applicable documents	Honeywell
Background	Boeing
Introduction to SHM systems	BAE Systems
Fields of application	Airbus and Boeing
SHM system requirements	Airbus
Qualification V&V Certification	Hahn Spring (Consultant) and Sandia plus team
Military annex	AFRL

Illustrative work in progress

Working definitions and examples of credits / benefits

- **The maintenance credit/benefit** functions achieve specific improved maintenance tasks that can replace existing tasks or can be considered as **Alternative Means of Compliance (AMOC)** to existing inspection tasks. Examples of such tasks are (a) detect a falsely reported hard-landing event and eliminate the inspection required after the event, (b) detect structural damage at fixed scheduled intervals (S-SHM), (c) indicate need/opportunity to change maintenance planning (turning unscheduled into scheduled maintenance) etc.

Working definitions and examples of credits / benefits

- **The maintenance credit/benefit** functions achieve specific improved maintenance tasks that can replace existing tasks or can be considered as **Alternative Means of Compliance (AMOC)** to existing inspection tasks. Examples of such tasks are (a) detect a falsely reported hard-landing event and eliminate the inspection required after the event, (b) detect structural damage at fixed scheduled intervals (S-SHM), (c) indicate need/opportunity to change maintenance planning (turning unscheduled into scheduled maintenance) etc.
- **The operational credit/benefit** functions achieve improved operational, management and structural integrity tasks that can **replace existing tasks** or can result in maintenance planning benefits as **increasing inspection intervals**. For example, load and fatigue monitoring functions can be used to adjust scheduled task intervals or trigger crack inspection tasks.

Working definitions and examples of credits / benefits

Embodied in MSG-3 IP 2009-1

- **The maintenance credit/benefit** functions achieve specific improved maintenance tasks that can replace existing tasks or can be considered as Alternative Means of Compliance (AMOC) to existing inspection tasks. Examples of such tasks are (a) detect a falsely reported hard-landing event and eliminate the inspection required after the event, (b) detect structural damage at fixed scheduled intervals (S-SHM), (c) indicate need/opportunity to change maintenance planning (turning unscheduled into scheduled maintenance) etc.
- **The operational credit/benefit** functions achieve improved operational, management and structural integrity tasks that can replace existing tasks or can result in maintenance planning benefits as increasing inspection intervals. For example, load and fatigue monitoring functions can be used to adjust scheduled task intervals or trigger crack inspection tasks.
- **The design credit** will be sought to underwrite new designs and materials.

SHM in MSG-3 revision 2009.1

An S-SHM task:

- *would be a generic AMM task procedure **without** Non-Destructive Test Method (NTM)*
- *can be carried out with aircraft type rating **without** additional training*
- *uses technology with built in go/no-go determination capability*
- *significantly reduces human factors*

The fixed interval avoids operational issues!

- *No unplanned operational interruptions*
- *Safe operation within the interval scope per definition*
- *Potential SHM technology failure will be evident when performing the task*

Working definitions and examples of credits / benefits

- **The maintenance credit/benefit** functions achieve specific improved maintenance tasks that can replace existing tasks or can be considered as Alternative Means of Compliance (AMOC) to existing inspection tasks. Examples of such tasks are (a) detect a falsely reported hard-landing event and eliminate the inspection required after the event, (b) detect structural damage at fixed scheduled intervals (S-SHM), (c) indicate need/opportunity to change maintenance planning (turning unscheduled into scheduled maintenance) etc.
- **The operational credit/benefit** functions achieve improved operational, management and structural integrity tasks that can replace existing tasks or can result in maintenance planning benefits as increasing inspection intervals. For example, load and fatigue monitoring functions can be used to adjust scheduled task intervals or trigger crack inspection tasks.
- **The design credit** will be sought to underwrite new designs and materials.

Aspiration and logical end goal for SHM to fully utilize its capability....IP 105

SHM in MSG-3 IP105

SHM Operation Mode

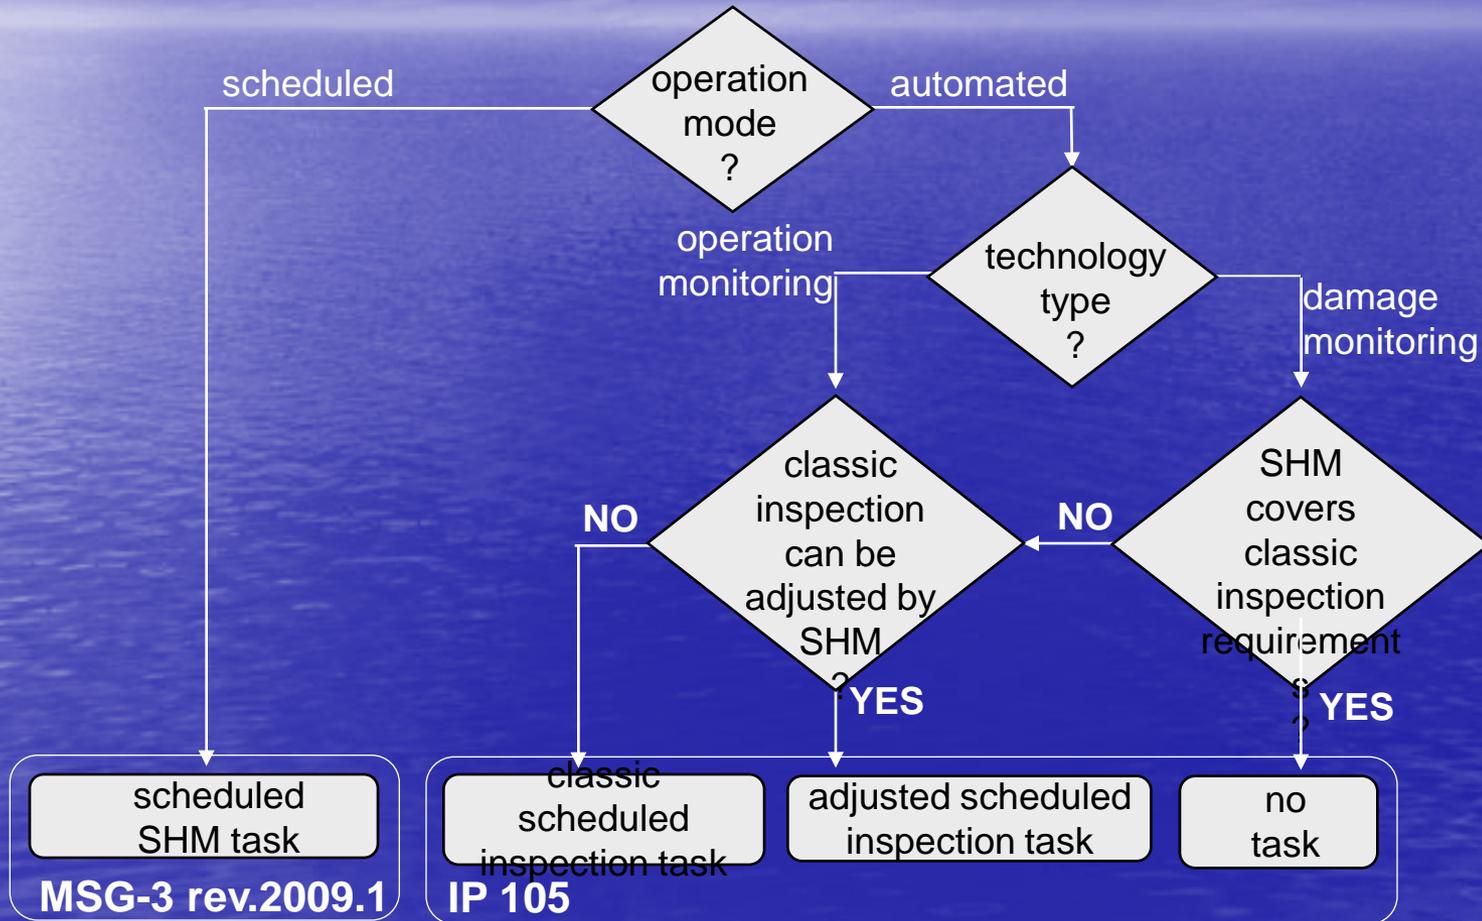

- **Scheduled SHM (S-SHM)** – from IP92, no change
- **Automated SHM** - SHM technology which does not have a pre-determined interval at which maintenance action much takes place, but instead relies on the system to inform maintenance personnel that action must take place

SHM Technology Type

- **Damage Monitoring System** – SHM technology that uses sensors to **directly** monitor structure for deterioration conditions
- **Operation Monitoring System** – SHM technology that uses sensors which do **not directly** check the structure for damage, but instead correlate various measurements (e.g. environment conditions, loads) to make an inference to the probability or likelihood of damage

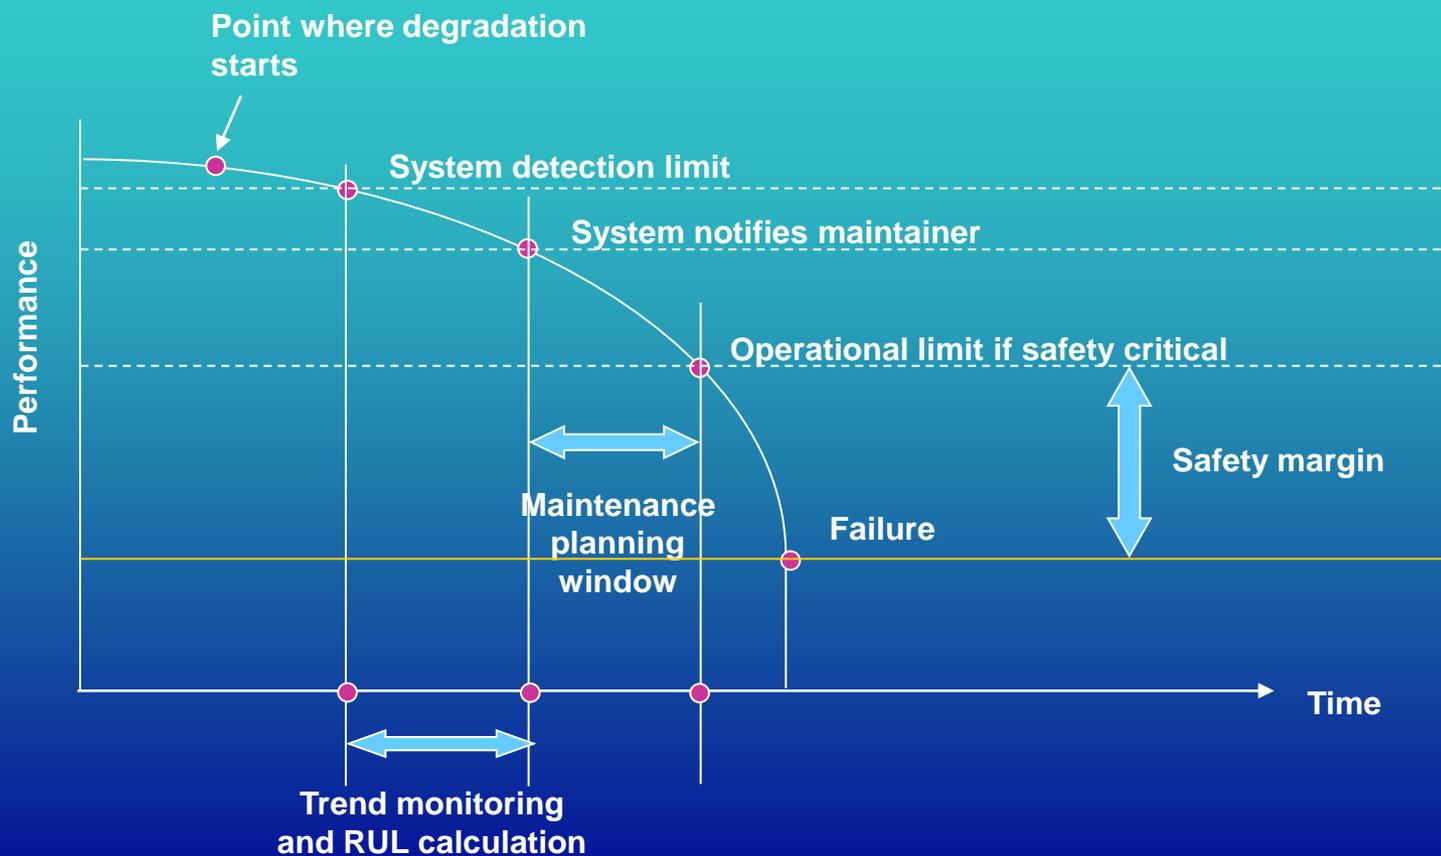

SHM in MSG-3 IP105

Principle SHM evaluation procedure

Automated SHM allows true CBM

In Summary

- The AISC-SHM is preparing SAE International Aerospace Recommended Practices guidelines for the implementation of SHM for aerospace application
- Target date for publication 2012
- The group draws on a wide range of OEMs, integrators, regulators and technology providers
- The AISC overlaps with the ATA MSG-3 revision process via the ATA MSG-3 SHM Working Group
- Successful revisions and Issue Papers from the ATA working group will be reflected in the AISC guidelines.

Challenge to the industry

- Issue guidelines for implementation of SHM using wide consultation with industry, regulator and user communities.
- OEMs, Technology Developers and suppliers must join efforts to present real S-SHM and A-SHM applications proposals to Regulatory Authorities in the next couple of years: only this will convince all stakeholders of the value of SHM.
