## i. Preface

The Wide Area Differential GPS (WADGPS) Laboratory of Stanford University has developed the Matlab Algorithm Availability Simulation Tool, MAAST, to provide a tool for availability simulation of the Wide Area Augmentation System. This software is available in the public domain for users wishing to simulate the impact on WAAS availability as a result of proposed changes in the system.

To support the public use of this tool, the MAAST Software Developer's Guide is provided to assist those wishing to use, modify or tailor MAAST for their own specific purposes. The purposes of this guide are provided below:

- Identify the key features of the MAAST program that allows users to customize and modify the code for their own application.
- Provide necessary information to the user to simplify the code and subroutine customizations.
- Provide detailed reference information of files, functions and data matrixes to facilitate end-user software modifications.

Key references are listed in Section 4. Feedback on MAAST is welcome and encouraged. Please direct comments to The Wide Area Differential GPS (WADGPS) Laboratory of Stanford University.

## ii. About this Manual

Easy customization of MAAST was a key design philosophy in developing this code. This manual is provided to support the customization of MAAST and is organized to follow the organization of the code itself. The general approach and key ideas for customizing MAAST are summarized below:

1. Ensure a complete set of MAAST files is available before starting. Refer to Appendix #1 for a complete listing of files provided.
2. This manual and MAAST codes are provided for familiarization with the functional flow, basic assumptions and customization procedures of MAAST.
3. Knowledge of the input/output requirements of the desired algorithms can be quickly found by checking the feval lines in the codes. The use of identical names for inputs/outputs will simplify customization. Summary tables are included for major computation algorithms.
4. MAAST uses global variables to initialize variable names as part of a philosophy to minimize variable name changes and simplify variable use within the multiple .m files of MAAST. The global variable appear in all capital letters at the beginning of the MAAST .m files. Global declarations of all *init\_xxx.m* files are located within the associated .m file.
5. MAAST utilizes initialization files (*init\_xx.m*) as a “#define” approach so MAAST can call different functions and/or data without having to modify the original init.m files.
6. MAAST uses the following system to name .m files:
  - af\_ : Algorithm .m files
  - init\_ : Initialization #define .m files described in #5 above.
  - calc\_ : Calculation .m files
  - gui\_ : GUI related .m files

## iii. MAAST Overview

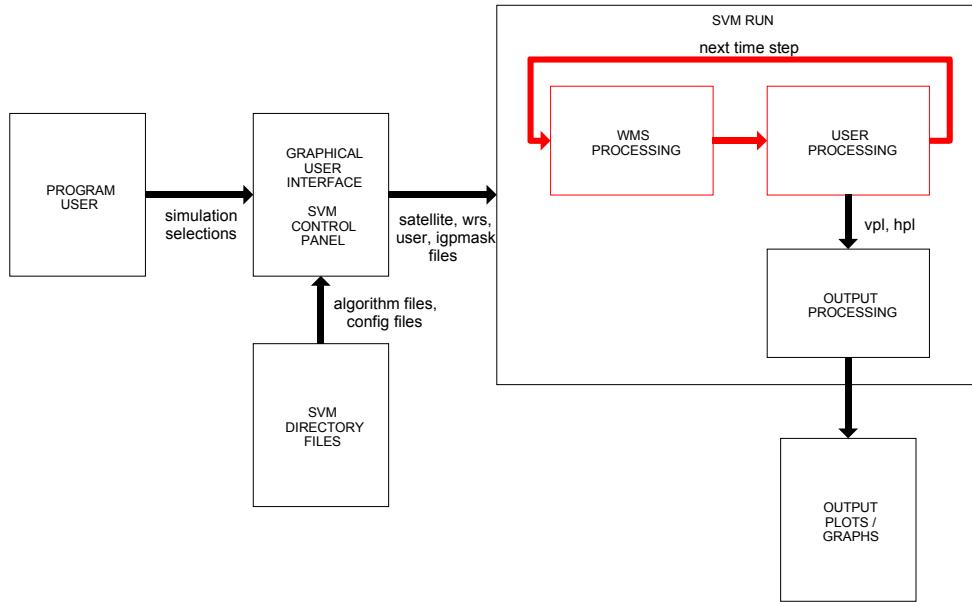

MAAST was designed for easy modification and changes to the code for user specific customization. Modified algorithms can be integrated quickly into MAAST by modifying only a few lines of code.

To facilitate flexibility, MAAST is organized into the following functional areas:

1. **Graphical User Interface (GUI):** User specified inputs.
2. **SVM directory files:** Containing WRS, satellite, IGP and other data files.
3. **Algorithm and Simulation:** Primary error algorithm processing
  - Satellite/User computations: Computed at each time interval
  - WMS processing: CNMP,TROPO,UDRE and GIVE computations
  - User processing: User error computations
  - Output processing: Availability, HPL and VPL processing as requested
4. **Output display:** Color displays of availability, HPL and VPL contour plots.

This guide provides all the necessary information to make rapid customization to functional areas one, two and three above. Modifications of the output display are not provided in this document. A top-level block diagram is provided below in Figure #1 showing the functional areas and the top-level algorithm flow for MAAST.

**SVM Analysis Block Diagram ( Top Level View )**

**Figure #1: SVM Analysis Block Diagram**

#### iv. MAAST files most commonly modified

The following files are frequently referenced and/or modified during the customization of MAAST:

- *initgui.m* – Primary GUI file where algorithm changes are implemented.
- *guicbfun.m* – GUI file that assigns name strings to selected algorithm functions.
- *svmrnrun.m* – Main computational algorithm.
- *wmsprocess.m* - WAAS master station processing algorithm.
- *usrprocess.m* – User processing alorithm
- *outprocess.m* – File that formats and displays results of simulation
- *init\_col\_labels.m* – File that initializes column names for matrixes in MAAST.

## 1 Graphical User Interface

The MAAST Graphical User Interface (GUI) allows the user to specify algorithms and simulation parameters for analysis. The GUI can be easily customized for user specific modifications. Figure #2 shows the GUI displayed by MAAST.

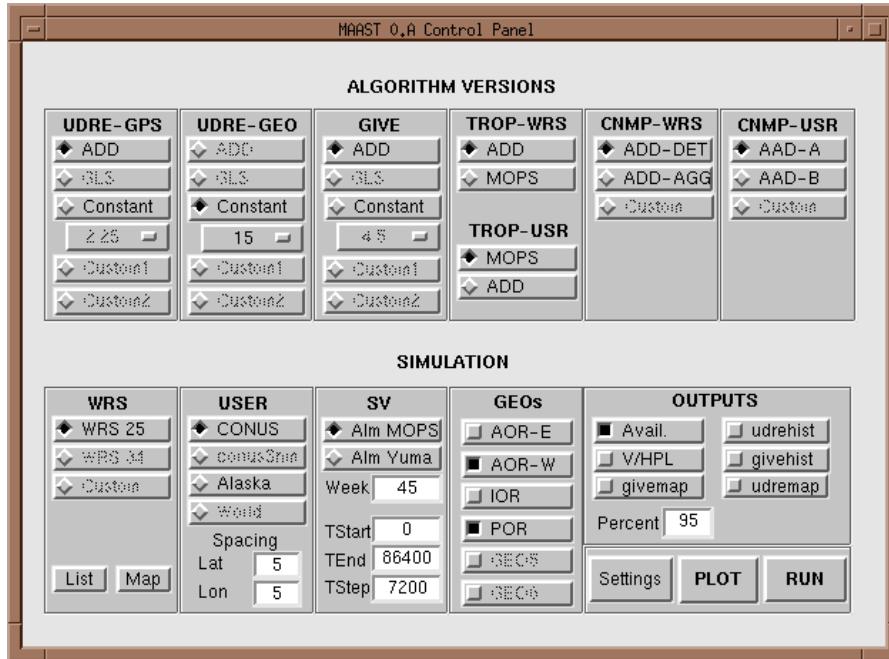

Figure #2: MAAST Control Panel GUI

“Custom” selections buttons are pre-programmed into the GUI. The GUI may be modified for additional buttons if desired. Selection buttons appear “grayed-out” when there is no associated algorithm in MAAST. When a custom algorithm or simulation is integrated into MAAST, the GUI button will reflect the name of the customized subroutine and will no longer be ‘greyed-out’. This feature allows users to add subroutines and selection buttons to build the flexibility of MAAST. Table #1 summarizes the selections currently available in MAAST.

Table #1: MAAST Control Panel Selections

| Algorithms | Selections available  |
|------------|---|
| UDRE-GPS   | CONSTANT option activates a list of indexed UDRE values from which to choose from. This sets all GPS satellite UDREs to the specified constant. |
| UDRE-GEO   | CONSTANT option activates a list of indexed UDRE values from which to choose from. This sets all GEO UDREs to the specified constant.           |
| GIVE       | CONSTANT option activates a list of indexed GIVE values from which to choose from. This sets all IGP GIVES to the specified constant.           |
| TROPO-WRS  | WAAS MOPS   |
| TROPO-USR  | WAAS MOPS   |
| CNMP-WRS   | Selects WRS model used to describe the airborne error contribution as a function of elevation angle and/or time tracked.                        |
| CNMP-USR   | Selects WRS model used to describe the airborne error contribution as a function of elevation angle and/or time tracked.                        |

| <b>Simulation</b> |   |
|-------------------|---|
| WRS               | 1. WRS 25 uses the 25 reference station used by the NSTB testbed.<br>2. LIST / MAP buttons show a list/map of the selected WRS network.   |
| USER              | 1. CONUS selects users within the continental United States.<br>2. ALASKA selects users in Alaska.<br>3. LAT / LON fields specify user grid resolution in degrees.  |
| SV                | 1. YUMA uses almanac file corresponding to the specified week.<br>2. TSTART, TEND, and TSTEP specify the time steps for the simulation in seconds.  |
| GEOs              | 1. AOR-E<br>2. AOR-W<br>3. IOR<br>4. POR  |
| <b>Outputs</b>    | Availability contour<br>VPL contour<br>HPL contour<br>UDRE map<br>GIVE map<br>UDRE / $\sigma_{\text{fl}}$ histogram<br>GIVE / UIVE histogram  |
| <b>Other</b>      | 1. PERCENT field specifies the availability percentage on which the VPL and HPL plots are based.<br>2. RUN button runs simulation and plots selected outputs.<br>3. PLOT button plots selected outputs for latest simulation run.<br>4. SETTINGS button opens new window for simulation settings. (Not available as of this writing.) |

## 1.1 Key GUI File Information

Table #2 provides a summary description of key GUI files used in MAAST.

**Table #2: GUI Summary Table**

| <b>File</b>      | <b>Description</b>  |
|------------------|---|
| init_gui.m       | Main routine, builds GUI <ul style="list-style-type: none"> <li>• Input: Global function/routines</li> <li>• Output: Global function/routines</li> </ul>  |
| gui_mexclude.m   | <b>Function</b> gui_mexclude(obj_list,sel_obj) <ul style="list-style-type: none"> <li>• Obj_list: list of handles of objects not selected (to be mutually excluded).</li> <li>• Sel_obj: list of handles selected in the GUI</li> </ul> |
| gui_readnum.m    | <b>Function</b> num=gui_readnum(hndl,llim,ulim,errmsg) <ul style="list-style-type: none"> <li>• Reads the value of a numerical text box.</li> </ul>   |
| gui_readselect.m | <b>Function</b> iselect = gui_readselect(objlist) <ul style="list-style-type: none"> <li>• Returns the index of the selected option/s (Value field = 1) in a list of object handles.</li> </ul>   |
| guicbfun.m       | <b>Function</b> guicbfun(hndl) <ul style="list-style-type: none"> <li>• Assigns the working variable name to the algorithm selected by the GUI.</li> </ul>  |

## 2 SVM Directory Files and Data Matrixes

MAAST draws upon several data files for data used in computations. Table #3 lists the eight data files provided with MAAST. Appendix #2 provides detailed file information and formats for reference.

**Table #3: MAAST data files**

| Data File                                | Description  |
|--|--|
| usrconus.dat                             | Longitude and Latitude of boundary of user region in continental U.S.  |
| usalaska.dat                             | Longitude and Latitude of boundary of user region in Alaska.   |
| wrs25.dat                                | Longitude and Latitude of location of WAAS reference stations  |
| igpaor.dat<br>igppor.dat<br>igpjoint.dat | Mask grid of active ionospheric grid points in Longitude and Latitude for Atlantic (aor) Pacific (por) and joint (both). |
| geo.dat                                  | Data for geostationary satellites  |
| almmops.dat                              | Weekly almanac data  |

MAAST takes data from these files and generates matrixes used for satellite, user and reference station computations. Critical MAAST matrixes are mapped and provided in Appendix #4 contains a function map that provides information on inputs and outputs of the major functions of MAAST. Appendix #5 for reference on matrix organization, size, data units and relations within MAAST.

### 2.1 Customizing MAAST Data Files

The following procedure is provided to customize data files used by MAAST.

#### 2.1.1 MAAST Data File Modification Procedure:

1. Modify existing data file with new information.
2. Save the modified data file with a custom name or for minor changes save over the old file.
3. Make the following modification to the *init\_gui.m* file:
  - Modify the *GUI\_xxx\_DAT* line of code with the name of the new data file.
  - Modify the *GUI\_xxx\_MENU* line of code with to the desired name for the button used in the GUI for the routine
4. Save changes to the *init\_gui.m* file and run MAAST.

#### 2.1.2 MAAST Data File Modification Example

A user has generated a custom WRS data file named “wrsspecial.dat” To integrate this into MAAST, the user would open the *init\_gui.m* file and go to the following lines:

```
GUI_WRS_DAT = {'wrs25.dat','wrs34.dat','wrscustom.dat'};  
GUI_WRS_MENU = {'WRS 25','WRS 34','Custom'};
```

Substitute ‘wrscustom.dat’ with ‘wrsspecial.dat’ and ‘Custom’ with ‘WRS Special’ to change the code as follows:

```
GUI_WRS_DAT = {'wrs25.dat','wrs34.dat','wrsspecial.dat'};  
GUI_WRS_MENU = {'WRS 25','WRS 34','WRS Special'};
```

### 2.1.3 YUMA Data file Selection Procedure

The MAAST user has the option of selecting YUMA almanac data for analysis. This is accomplished as follows: modify the data file prior to maast stip off blank lines

1. Obtain recent YUMA almanac data from the following web site  
<http://www.navcen.uscg.gov/ftp/GPS/almanacs/yuma/> and save the file as 'almyuma\_xxx\_dat' in the same directory as MAAST.
2. When running MAAST, select 'Alm Yuma' on the GUI to utilize YUMA data for analysis.

## 2.2 Satellite Data Calculations

MAAST takes raw almanac data from the almmops.dat file and stores it into matrixes *alm\_param* and *satdata* for use in MAAST as follows:

1. Recent almanac data is pulled from a file and stored into *alm\_param* matrix(n x 12)
2. *init\_satdata.m* initializes the *satdata* matrix (n x 27)
3. *init\_satdata.m* calls *alm2satposve.ml* function to take raw almanac data at time *t* and calculates the ECEF XYZ position and velocity for each satellite and stores the data into the *satdata* matrix.

At each increment of time, *t*, *init\_satdata.m* calls *alm2satposvel.m* and recalculates satellite position for the next increment of time *t*. This data is written over previous data in the *satdata* matrix. Please refer to Appendix #5 for data mapping of *alm\_param* and *satdata* matrixes.

## 3 Algorithm and Simulation

A description of the major simulation and analysis computations is provided below. Primary MAAST computations are performed by *svmrun.m*. Custom algorithms and simulations can be integrated into MAAST easily. When customizing algorithms it is essential to match the input/output information and data formats.

### 3.1 SVM Simulation

The primary computational algorithm for MAAST is the SVM simulation routine located in the *svmrun.m* (see Figure #3 below). SVM's performs the following key functions:

1. Initializes *satdata*, *wrsdata* and *igpdata* matrixes.
2. Calculates LOS rise times for CNMP calculations
3. Establishes tstart at tstart – cnmp-tl3 (below this CNMP is at floor value)
4. For the time period and time steps specified by the GUI, SMV calls the following algorithms for calculations
  - *wmsprocess.m* for UDRE and GIVE calculations
  - *usrprocess.m* vpl and hpl calculations
  - *outputprocess.m* for output displays.

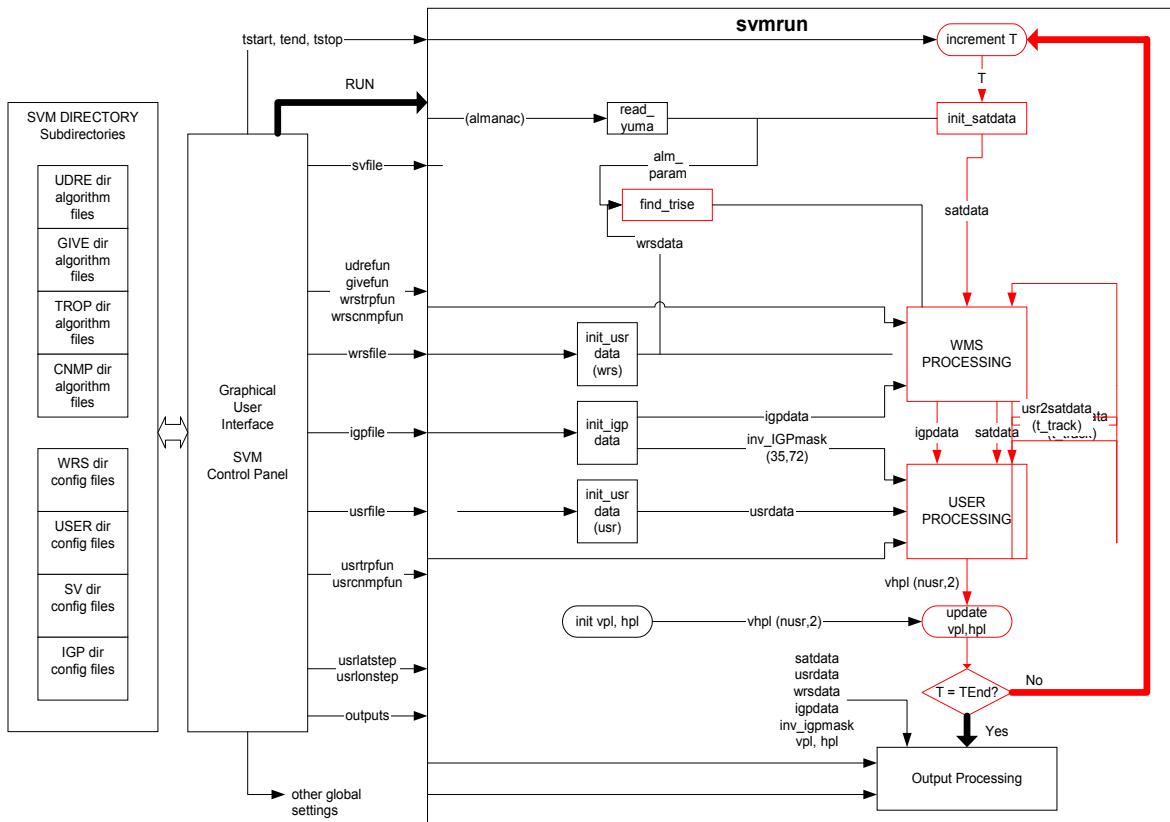

Figure #3: SVM Processing Flow

Table #4: SVMRUN Summary Table

| <b>Svmrun.m</b>   |  |
|---|--|
| <b>Function Line</b>  |  |
| Function svmrun(gpsudrefun, geoudrefun, givefun, usrrpfun, usrcnmpfun, wrstrpfun, wrsgpscnmpfun, wrsgeocnmpfun, wrsfile, usrfile, igpfile, svfile, geodata, tstart, tend, tstep, usrlatstep, usrlonstep, outputs, percent);   |  |
| Inputs  | Outputs  |
| gpsudrefun- udre calculation for GPS satellites<br>geoudrefun – udre calculation for GEO satellites<br>givefun – give calculation<br>usrrpfun - tropo delay calculation for user<br>usrcnmpfun – cnmp delay calculation for user<br>wrstrpfun - tropo delay calculation for wrs<br>wrsgpscnmpfun – cnmp delay calculation for wrs<br>wrsfile – wrs position data<br>usrfile – user position boundary polygon<br>igpfile- IGP mask points<br>svfile – Yuma almanac file if Tstep not zero<br>Static satellite position file if Tstep is zero<br>tstart – start time of simulation (for almanac option)<br>tend-end time of simulation (for almanac option)<br>tstep- time step of simulation (for almanac option), should be 0<br>for static satellite position option | Array of ON-OFF flags (1 for ON, 0 for OFF) for output options, corresponding to:<br>1) Availability<br>2) UDRE map<br>3) GIVE map<br>4) UDRE histogram<br>5) GIVE histogram<br>6) VPL and HPL |

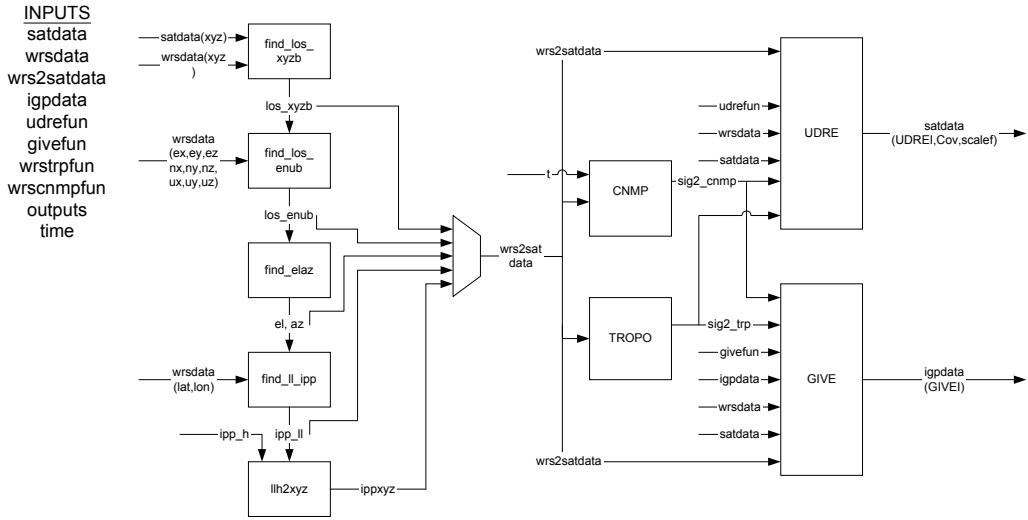

### 3.2 WMS Processing

When called by *svmrn*, the wmsprocess algorithm simulates the computations performed by the WAAS master stations for each time interval using data from the WAAS reference stations. See Figure #4 below. These computations include the following:

1. CNMP: Noise/Multi-path error variance
  - Carrier phase is continuous while the satellite-to-reference station elevation angle exceeds the visibility limit ( $5^\circ$ ) by the WAAS MOPS
  - Cycle slips do not occur.
  - Satellite rise times are calculated to 1-second accuracy.
2. TROPO: Troposphere error variance
3. UDRE/GIVE calculations

This data is stored in the *wrs2sat\_data* matrix that includes the type 28 covariance matrixes.

## WMS PROCESSING (UDRE/GIVE)

**Figure #4: WMS Processing Flow (UDRE/GIVE)**

**Table #5: WMS Process Summary Table**

| wmsprocess.m  |   |
|---|---|
| Function Line   |   |
| <pre>function [satdata,igpdata,wrs2satdata] = wmsprocess(alm_param, satdata, wrsdata, igpdata, wrs2satdata, gpsudrefun, geoudrefun, givefun, wrstrpfun, wrsgpscnmpfun, wrsgeocnmpfun, outputs, time, tstart, tstep,trise)</pre> |   |
| Inputs  | Outputs   |
| alm_param<br>satdata<br>wrsdata<br>igpdata<br>wrs2satdata<br>gpsudrefun<br>geoudrefun<br>givefun  | Wrstrpfun<br>Wrsgpscnmpfun<br>Wrsgeocnmpfun<br>Outputs<br>Time<br>Tstart<br>Tstep<br>trise<br><br>satdata<br>igpdata<br>wrs2satdata |

### 3.3 Custom WMS Processing

New WMS algorithms are easily incorporated into MAAST provided they include the same inputs and outputs used by MAAST. This is accomplished by referring to the feval function lines in the code to ensure the custom algorithm will match the same inputs called in MAAST. For convenience, those lines are provided in Table #6 below:

**Table #6: Feval Lines in wmsprocess.m**

|       | Input/Output matching for customizing WMS processing   |
|-------|--|
| TROPO | wrs2satdata(:,COL_U2S_EL) = feval(wrstrpfun,el)  |
| CNMP  | wrs2satdata(gps,COL_U2S_SIG2L1MP) = feval(wrsgpscnmpfun,ttrack(gps),el(gps));<br>wrs2satdata(geo,COL_U2S_SIG2L1MP) = feval(wrsgeocnmpfun,ttrack(geo),el(geo));               |
| UDRE  | Satdata(sgps,:) = feval(gpsudrefun, satdata(sgps,:), wrsdata,wrs2satdata(gps,:), 1);<br>Satdata(sgeo,:) = feval(geoudrefun, satdata(sgeo,:), wrsdata,wrs2satdata(geo,:), 1); |

When making a custom algorithm ensure the new function is consistent with the inputs and outputs called for in MAAST. For example, if making a new GPS CNMP algorithm, refer to the table above to match the inputs and outputs of the feval line. The new function should use ttrack(gps) and el(gps) as inputs to the *wrsgpscnmpfun.m* algorithm.

### 3.3.1 Procedure for Custom WMS algorithms (CNMP, TROPO or UDRE)

1. Compose the custom WMS algorithm function as a .m file in Matlab saved in the same directory as all MAAST files. For consistency, all algorithm files in MAAST begin with ‘af\_’.
2. Make the following modification to the *init\_gui.m* file:
  - Modify the ‘af\_xxxxcustom1’ text of the associated *xxxx\_xxxx\_ALGO* line of code to the name of the custom routine .m file.
  - Modify the ‘Custom1’ text of the associated *xxxxxxxxx\_MENU* line of the code to the desired name for the button used in the GUI for the routine.
3. Save the *init\_gui.m* file and run MAAST.

### 3.3.2 Custom WMS Modification Example

A user has generated a custom algorithm for WRS CNMP calculation named *af\_cnmfspesial.m*. To integrate this into MAAST, the user would open the *init\_gui.m* file and go to the following lines:

```
GUI_WRSCNMP_ALGO = {'af_cnmfspesial','af_cnmfagg','af_wrscnmpcustom'};
GUI_WRSCNMP_MENU = {'ADD-DET','ADD-Agg','Custom'};
```

Substitute ‘af\_wrscnmpcustom’ with ‘af\_cnmfspesial’ and ‘Custom’ with ‘CNMP Special’ to change the code as follows:

```
GUI_UDREGPS_ALGO = {'af_udreadd','af_udregis','af_udreconst','af_cnmfspesial ','af_udrecustom2'};
GUI_WRSCNMP_MENU = {'ADD-DET','ADD-Agg','CNMP Special'};
```

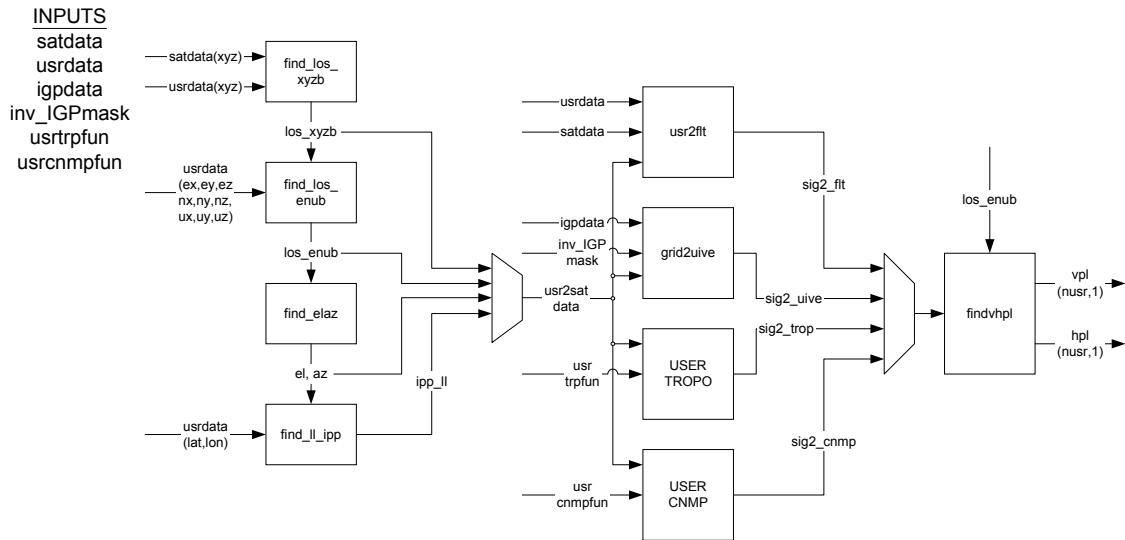

The button in the GUI is now renamed and linked to the custom function. Selecting this button on the GUI will run the custom function as the UDRE function in the SVM run algorithm.

## 3.4 User Processing

Following WMS processing by svmrn, “User Processing” simulates the WAAS user’s computations of confidence bounds on clock/ephemeris and ionospheric corrections at the user site. See Figure #5 below. These confidence bounds are then used to derive the VPL and HPL values. Using the previously generated line-of-site data *usrprocess.m* implements two modules in accordance with WAAS Mops as follows:

1. *udre2flt.m*: Projects satellite UDRE’s with MT28 covariance matrixes into fast and long-term correction variances,  $\sigma^2_{\text{flt}}$  for each user line-of-site.
2. *grid2uive.m*: Derives user ionospheric correction variances,  $\sigma^2_{\text{uive}}$ , for each user line-of-site.

## **USER PROCESSING**

**Figure #5: USER Processing Flow**

**Table #7: User Process Summary Table**

### 3.5 User processing Modifications

Modifications to user processing can be accomplished in the same manner as changes to WMS processing above.

### 3.6 Output Processing

Once user processing completes the updates of VPL and HPL for the time period of analysis, *svmrn.m* calls *outprocess.m* to prepare and display the data requested by the user in the GUI. This completes the MAAST processing.

**Table #8: Output Process Summary Table**

| <b>outputprocess.m</b>   |            |  |
|--|------------|--|
| <b>Function Line</b>   |            |  |
| <b>Inputs</b>  |            | <b>Outputs</b><br>(if selected in GUI) |
| <b>Function</b> outputprocess(satdata,usrdata,wrsdata,igpdata,inv_igp_mask, sat_xyz, udrei,givei,usrvpl, usrhpl,latgrid,longrid,outputs,percent,udre_hist,give_hist,udrei_hist,givei_hist) |            |  |
| satdata  | Usrhpl     | Availability contour                   |
| usrdata  | Latgrid    | VPL contour                            |
| wrsdata  | Longrid    | HPL contour                            |
| igpdata  | Outputs    | UDRE map                               |
| inv_igp_mask   | Percent    | GIVE map                               |
| sat_xyz  | udre_hist  | UDRE / $\sigma_{fl}$ histogram         |
| udrei  | give_hist  | GIVE / UIVE histogram                  |
| givei  | udrei_hist |  |
| usrvpl   | givei_hist |  |

#### Description

Contains ionospheric grid point data

#### Where modified

init\_igpdata.m

#### Where used or called

svmrn.  
wmsprocess.m: data from IGPMATRIX used for processing  
usrprocess.m data from IGPMATRIX used for processing  
outprocess.m  
quicfun.m: called in function outprocess

**Rows**
**USRDATA Matrix**
User<sub>1</sub>

User...

User<sub>n</sub>
**Description**
**Where modified**
**Where used or called**

Matrix containing the user data

init\_usrdata.m initializes the matrix and inputs the data prior to svm analysis

init\_usr2satdata.m called in function usr2satdata  
 project2user.m  
 guicfun.m called in function outprocess  
 outputprocess.m called in function outprocess and for plots  
 svmrn.m calles for intialization of matrix, establishes sizes

| WRSDATA Matrix      |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|
| WRS <sub>1</sub>    |  |  |  |  |  |  |  |  |  |  |  |  |  |
| WRS <sub>....</sub> |  |  |  |  |  |  |  |  |  |  |  |  |  |
| WRS <sub>n</sub>    |  |  |  |  |  |  |  |  |  |  |  |  |  |

**Description**
**Where modified**
**Where used or called**

Matrix containing the WRS location and position data from file

init\_wrsdata.m - initializes and adds data

af\_geoconst.m called in function satdata  
 af\_giveadd.m called in function igodata  
 af\_udread.m called in function satdata and other calculations  
 guicfun.m called in function outprocess  
 outputprocess.m called in function outprocess and for plots  
 svmrn.m calles for intialization of matrix, establishes sizes  
 wmsprocess.m called in functions and for calculations
