

Estimating and Simulating a SIRD Model of COVID-19 for Many Countries, States, and Cities

Jesús Fernández-Villaverde and Chad Jones

Extended results for Bosnia and Herzegovina Based on data through October 9, 2020

### **Outline of Slides**

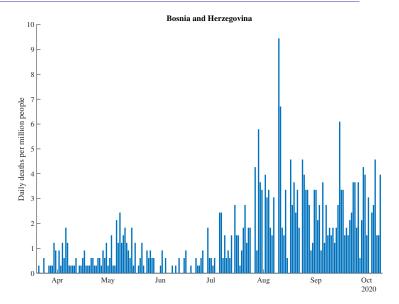

- Basic data from Johns Hopkins CSSE (raw and smoothed)
- Brief summary of the model
- Baseline results ( $\delta = 1.0\%$ ,  $\gamma = 0.2$ ,  $\theta = 0.1$ )
- Simulation of re-opening possibilities for raising R<sub>0</sub>
- Results with alternative parameter values:
  - $\circ$  Lower mortality rate,  $\delta = 0.8\%$
  - $\circ~$  Higher mortality rate,  $\delta=1.2\%$
  - $\circ~$  Infections last longer,  $\gamma=0.15$
  - $\circ$  Cases resolve more quickly, heta=0.2
  - $\circ~$  Cases resolve more slowly,  $\theta=0.07$
- Data underlying estimates of  $R_0(t)$

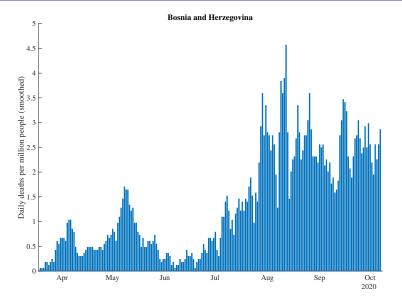

# Underlying data from Johns Hopkins CSSE

- Raw data
- Smoothed = 7 day centered moving average
- No "excess deaths" correction (change as of Aug 6 run)

### Bosnia and Herzegovina: Daily Deaths per Million People

### Bosnia and Herzegovina: Daily Deaths per Million People (Smoothed)

### **Brief Summary of Model**

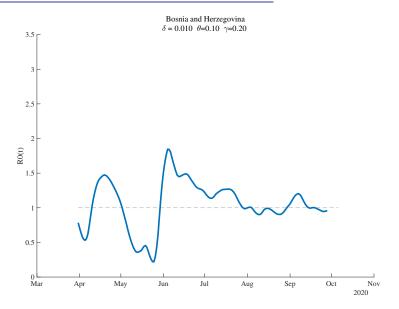

- See the paper for a full exposition
- A 5-state SIRDC model with a time-varying R<sub>0</sub>

Parameter	Baseline	Description
δ	1.0%	Mortality rate from infections (IFR)
$\gamma$	0.2	Rate at which people stop being infectious
heta	0.1	Rate at which cases (post-infection) resolve
$\alpha$	0.05	Rate at which $R_0(t)$ decays with daily deaths
$R_0$		Initial base reproduction rate
$R_0(t)$		Base reproduction rate at date $t$ ( $\beta_t/\gamma$ )

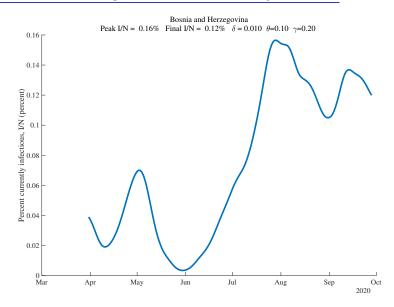

### Estimates of Time-Varying R<sub>0</sub>

- Inferred from daily deaths, and
- the change in daily deaths, and
- the change in (the change in daily deaths)
  (see end of slide deck for this data)

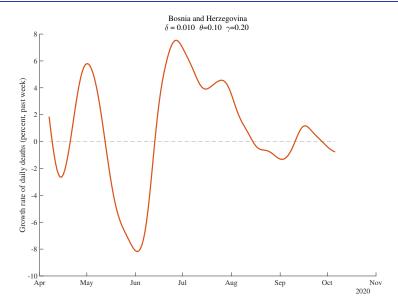

### Bosnia and Herzegovina: Estimates of $R_0(t)$

### **Bosnia and Herzegovina: Percent Currently Infectious**

### Bosnia and Herzegovina: Growth Rate of Daily Deaths over Past Week

### Notes on Intepreting Results

### **Guide to Graphs**

- Warning: Results are often very uncertain; this can be seen by comparing across multiple graphs. See the original paper.
- 7 days of forecasts: Rainbow color order! ROY-G-BIV (old to new, low to high)
  - Black=current
  - Red = oldest, Orange = second oldest, Yellow = third oldest...
  - Violet (purple) = one day earlier
- For robustness graphs, same idea
  - Black = baseline (e.g.  $\delta = 1.0\%$ )
  - Red = lowest parameter value (e.g.  $\delta = 0.8\%$ )
  - Green = highest parameter value (e.g.  $\delta = 1.2\%$ )

### How does R<sub>0</sub> change over time?

- Inferred from death data when we have it
- For future, two approaches:

1 Alternatively, we fit this equation:

 $\log R_0(t) = a_0 - \alpha$ (Daily Deaths)

 $\Rightarrow \alpha \approx .05$ 

*R*<sup>0</sup> declines by 5 percent for each new daily death, or rises by 5 percent when daily deaths decline

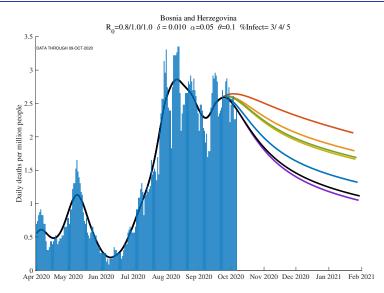

Robustness: Assume R<sub>0</sub>(t) = final empirical value. Constant in future, so no α adjustment → α = 0

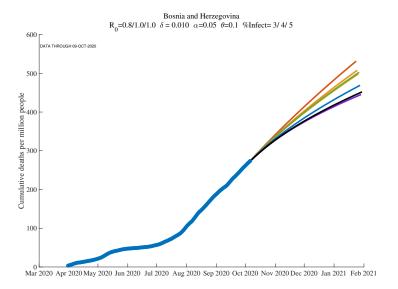

# Repeated "Forecasts" from the past 7 days of data

- After peak, forecasts settle down.
- Before that, very noisy!
- If the region has not peaked, do not trust
- With  $\alpha = .05$  (see robustness section for  $\alpha = 0$ )

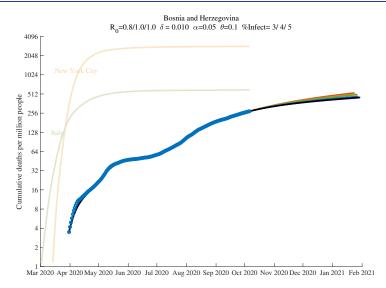

### Bosnia and Herzegovina (7 days): Daily Deaths per Million People ( $\alpha$ =

### Bosnia and Herzegovina (7 days): Cumulative Deaths per Million (Futu

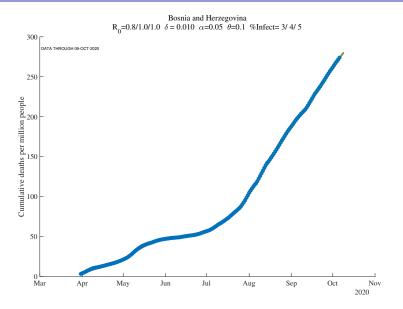

### Bosnia and Herzegovina (7 days): Cumulative Deaths per Million, Log

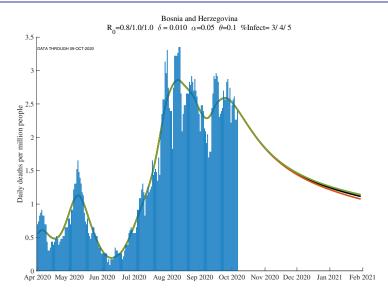

### Robustness to Mortality Rate, $\delta$

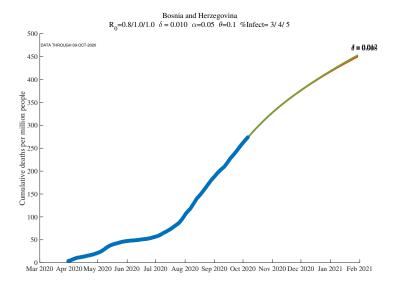

### Bosnia and Herzegovina: Cumulative Deaths per Million ( $\delta = .01/.008/.$

### Bosnia and Herzegovina: Daily Deaths per Million People ( $\delta = .01/.008$ )

### Bosnia and Herzegovina: Cumulative Deaths per Million ( $\delta = .01/.008/.$

## Reopening and Herd Immunity

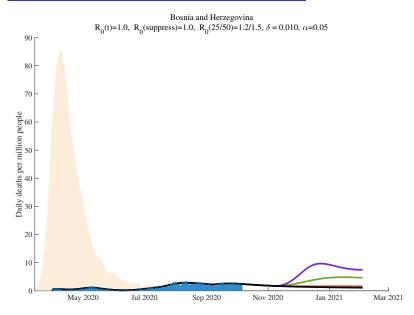

- Black: assumes  $R_0$ (today) remains in place forever
- Red: assumes  $R_0$ (suppress)= 1/s(today)

- Green: we move 25% of the way from  $R_0$ (today) back to initial  $R_0$  = "normal"

- Purple: we move 50% of the way from  $R_0$ (today) back to initial  $R_0$  = "normal"

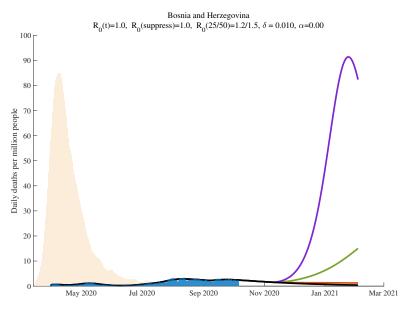

NOTE: Lines often cover each other up

### Bosnia and Herzegovina: Re-Opening ( $\alpha = .05$ )

(Light bars = New York City, for comparison)

### Bosnia and Herzegovina: Re-Opening ( $\alpha = 0$ )

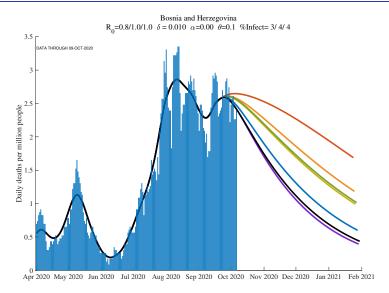

(Light bars = New York City, for comparison)

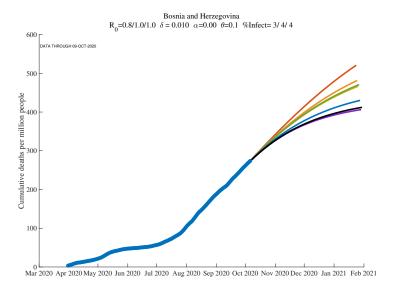

## Results for alternative parameter values

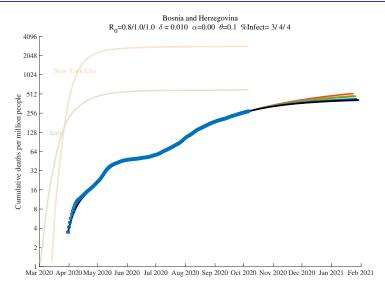

### Bosnia and Herzegovina (7 days): Daily Deaths per Million People ( $\alpha$ =

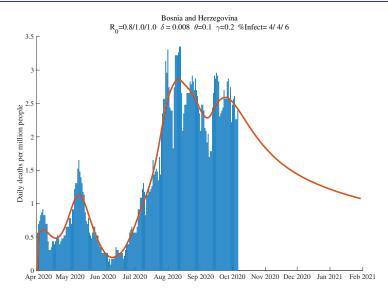

### Bosnia and Herzegovina (7 days): Cumulative Deaths per Million (Futu

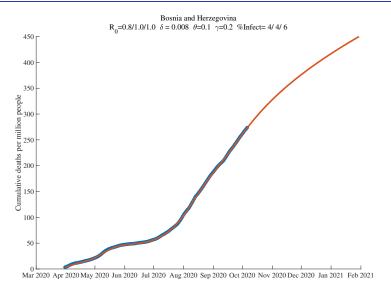

### Bosnia and Herzegovina (7 days): Cumulative Deaths per Million, Log

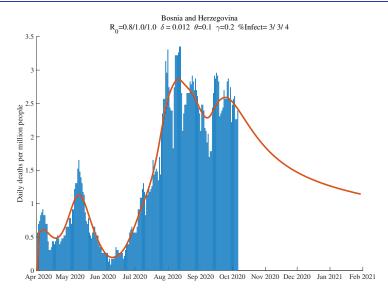

### Bosnia and Herzegovina: Daily Deaths per Million People ( $\delta = 0.8\%$ )

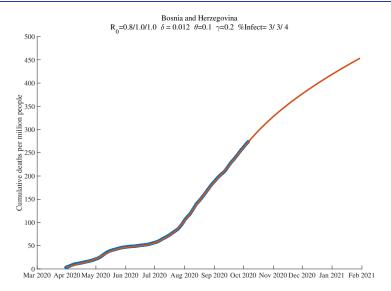

### Bosnia and Herzegovina: Cumulative Deaths per Million ( $\delta = 0.8\%$ )

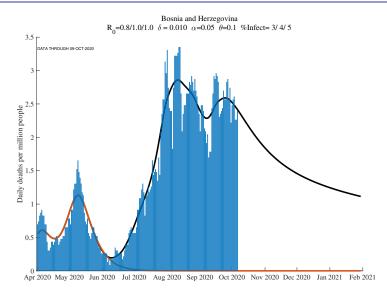

### Bosnia and Herzegovina: Daily Deaths per Million People ( $\delta = 1.2\%$ )

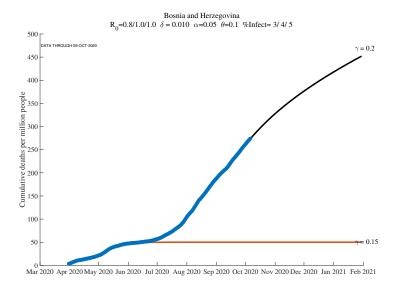

### Bosnia and Herzegovina: Cumulative Deaths per Million ( $\delta = 1.2\%$ )

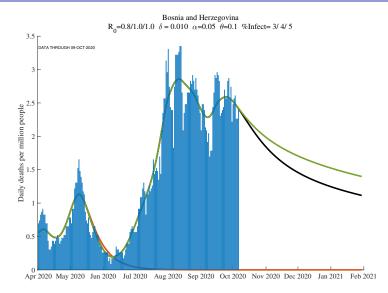

### Bosnia and Herzegovina: Daily Deaths per Million People ( $\gamma = .2/.15$ )

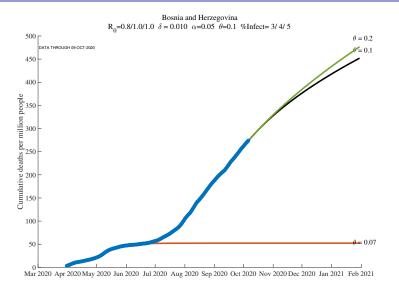

### Bosnia and Herzegovina: Cumulative Deaths per Million $\gamma = .2/.15$ )

### Bosnia and Herzegovina: Daily Deaths per Million People ( $\theta = .1/.07/.2$

#### Bosnia and Herzegovina: Cumulative Deaths per Million People ( $\theta = .1$

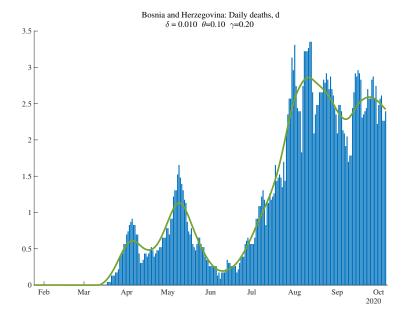

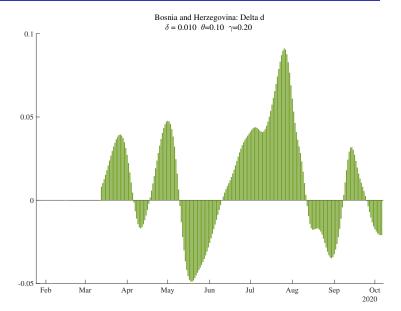

Data Underlying Estimates of Time-Varying *R*<sub>0</sub>

- Inferred from daily deaths, and
- the change in daily deaths, and
- the change in (the change in daily deaths)

### Bosnia and Herzegovina: Daily Deaths, Actual and Smoothed
