# Minimum Edit Distance 

## Definition of Minimum

## Edit Distance

## How similar are two strings?

- Spell correction
- The user typed "graffe" Which is closest?
- graf
- graft
- grail
- giraffe
- Computational Biology
- Align two sequences of nucleotides

## AGGCTATCACCTGACCTCCAGGCCGATGCCC TAGCTATCACGACCGCGGTCGATTTGCCCGAC

- Resulting alignment:
- AGGCTATCACCTGACCTCCAGGCCGA--TGCCC---TAG-CTATCAC--GACCGC--GGTCGATTTGCCCGAC
- Also for Machine Translation, Information Extraction, Speech Recognition

## Edit Distance

- The minimum edit distance between two strings
- Is the minimum number of editing operations
- Insertion
- Deletion
- Substitution
- Needed to transform one into the other

## Minimum Edit Distance

- Two strings and their alignment:

$$
\begin{aligned}
& \text { I NTE*NTION } \\
& \text { ||||||||| } \\
& \text { * E X E C U T O N }
\end{aligned}
$$

## Minimum Edit Distance

## I N T E * N T I O N <br>  <br> * E X E C U T I O N <br> $$
\mathrm{d} s \mathrm{~s} \quad \mathrm{i} \mathrm{~s}
$$

- If each operation has cost of 1
- Distance between these is 5
- If substitutions cost 2 (Levenshtein)
- Distance between them is 8

## Alignment in Computational Biology

- Given a sequence of bases

$$
\begin{aligned}
& \text { AGGCTATCACCTGACCTCCAGGCCGATGCCC } \\
& \text { TAGCTATCACGACCGCGGTCGATTTGCCCGAC }
\end{aligned}
$$

- An alignment:
-AGGCTATCACCTGACCTCCAGGCCGA--TGCCC---
TAG-CTATCAC--GACCGC--GGTCGATTTGCCCGAC
- Given two sequences, align each letter to a letter or gap

## Other uses of Edit Distance in NLP

- Evaluating Machine Translation and speech recognition
$\mathbf{R}$ Spokesman confirms senior government adviser was shot H Spokesman said the senior adviser was shot dead
S I
D
- Named Entity Extraction and Entity Coreference
- IBM Inc. announced today
- IBM profits
- Stanford President John Hennessy announced yesterday
- for Stanford University President John Hennessy

## How to find the Min Edit Distance?

- Searching for a path (sequence of edits) from the start string to the final string:
- Initial state: the word we're transforming
- Operators: insert, delete, substitute
- Goal state: the word we're trying to get to
- Path cost: what we want to minimize: the number of edits

## Minimum Edit as Search

- But the space of all edit sequences is huge!
- We can't afford to navigate naïvely
- Lots of distinct paths wind up at the same state.
- We don't have to keep track of all of them
- Just the shortest path to each of those revisted states.

## Defining Min Edit Distance

- For two strings
- X of length $n$
- Y of length $m$
- We define $\mathrm{D}(\mathrm{i}, \mathrm{j})$
- the edit distance between $\mathrm{X}[1 . . i]$ and $\mathrm{Y}[1 . . j]$
- i.e., the first $i$ characters of $X$ and the first $j$ characters of $Y$
- The edit distance between $X$ and $Y$ is thus $D(n, m)$

# Minimum Edit Distance 

## Definition of Minimum

## Edit Distance

# Minimum Edit Distance 

## Computing Minimum Edit Distance

## Dynamic Programming for Minimum Edit Distance

- Dynamic programming: A tabular computation of $D(n, m)$
- Solving problems by combining solutions to subproblems.
- Bottom-up
- We compute $D(i, j)$ for small $i, j$
- And compute larger $D(i, j)$ based on previously computed smaller values
- i.e., compute $\mathrm{D}(\mathrm{i}, \mathrm{j})$ for all $i(0<i<n)$ and $j(0<j<m)$

## Defining Min Edit Distance (Levenshtein)

- Initialization

$$
\begin{aligned}
& D(i, 0)=i \\
& D(0, j)=j
\end{aligned}
$$

- Recurrence Relation:

$$
\begin{aligned}
& \text { For each } i=1 \ldots . \mathrm{M} \\
& \text { For each } j=1 \ldots . . \mathrm{N}
\end{aligned}
$$

$$
D(i, j)=\min \left\{\begin{array}{l}
D(i-1, j)+1 \\
D(i, j-1)+1 \\
D(i-1, j-1)+ \\
2 ;
\end{array} \begin{array}{l}
\text { if } X(i) \neq Y(j) \\
\text { if } X(i)=Y(j)
\end{array}\right.
$$

- Termination:
$\mathrm{D}(\mathrm{N}, \mathrm{M})$ is distance

# Minimum Edit Distance 

## Computing Minimum Edit Distance

# Minimum Edit Distance 

## Backtrace for <br> Computing Alignments

## Computing alignments

- Edit distance isn't sufficient
- We often need to align each character of the two strings to each other
- We do this by keeping a "backtrace"
- Every time we enter a cell, remember where we came from
- When we reach the end,
- Trace back the path from the upper right corner to read off the alignment
Edit Distance

$$
D(i, j)=\min \left\{\begin{array}{l}
D(i-1, j)+1 \\
D(i, j-1)+1 \\
D(i-1, j-1)+ \begin{cases}2 ; & \text { if } S_{1}(i) \neq S_{2}(j) \\
0 ; & \text { if } S_{1}(i)=S_{2}(j)\end{cases}
\end{array}\right.
$$

## Adding Backtrace to Minimum Edit Distance

- Base conditions:

$$
D(i, 0)=i \quad D(0, j)=j
$$

- Recurrence Relation:

$$
\begin{aligned}
& \text { For each } i=1 . . . M \\
& \text { For each } j=1 \ldots \mathrm{~N}
\end{aligned}
$$

$$
\begin{aligned}
D(i, j)=\min & \left\{\begin{array}{lr}
D(i-1, j)+1 \\
D(i, j-1)+1 \\
D(i-1, j-1)+ & 2 ;
\end{array} \begin{array}{l}
\text { deletion } \\
\text { ifsertion } X(i) \neq Y(j)
\end{array}\right. \\
& \text { LEFT insertion }
\end{aligned}
$$

$\mathrm{Y}_{0}$
$\mathrm{y}_{\mathrm{M}}$

Every non-decreasing path
from $(0,0)$ to $(M, N)$
corresponds to an alignment of the two sequences

An optimal alignment is composed of optimal subalignments

## Result of Backtrace

- Two strings and their alignment:

$$
\begin{aligned}
& \text { INTE*NTION } \\
& \text { | | | | | | | | | | } \\
& \text { * EXECUTION }
\end{aligned}
$$

## Performance

- Time:
$\mathrm{O}(\mathrm{nm})$
- Space:

$$
\mathrm{O}(\mathrm{~nm})
$$

- Backtrace

$$
O(n+m)
$$

$$
\begin{array}{ll}
D(0,0)=0 & \\
D(i, 0)=D(i-1,0)+\operatorname{del}[x(i)] ; & 1<i \leq N \\
D(0, j)=D(0, j-1)+\operatorname{ins}[y(j)] ; & 1<j \leq M
\end{array}
$$

- Recurrence Relation:

$$
D(i, j)=\min \begin{cases}D(i-1, j) & +\operatorname{del}[x(i)] \\ D(i, j-1) & +\operatorname{ins}[y(j)] \\ D(i-1, j-1) & +\operatorname{sub}[x(i), y(j)]\end{cases}
$$

- Termination:

$$
\mathrm{D}(\mathrm{~N}, \mathrm{M}) \text { is distance }
$$

## Where did the name, dynamic programming, come from?

...The 1950s were not good years for mathematical research. [the] Secretary of Defense ...had a pathological fear and hatred of the word, research...

I decided therefore to use the word, "programming".

I wanted to get across the idea that this was dynamic, this was multistage... I thought, let's ... take a word that has an absolutely precise meaning, namely dynamic... it's impossible to use the word, dynamic, in a pejorative sense. Try thinking of some combination that will possibly give it a pejorative meaning. It's impossible.

Thus, I thought dynamic programming was a good name. It was something not even a Congressman could object to."
