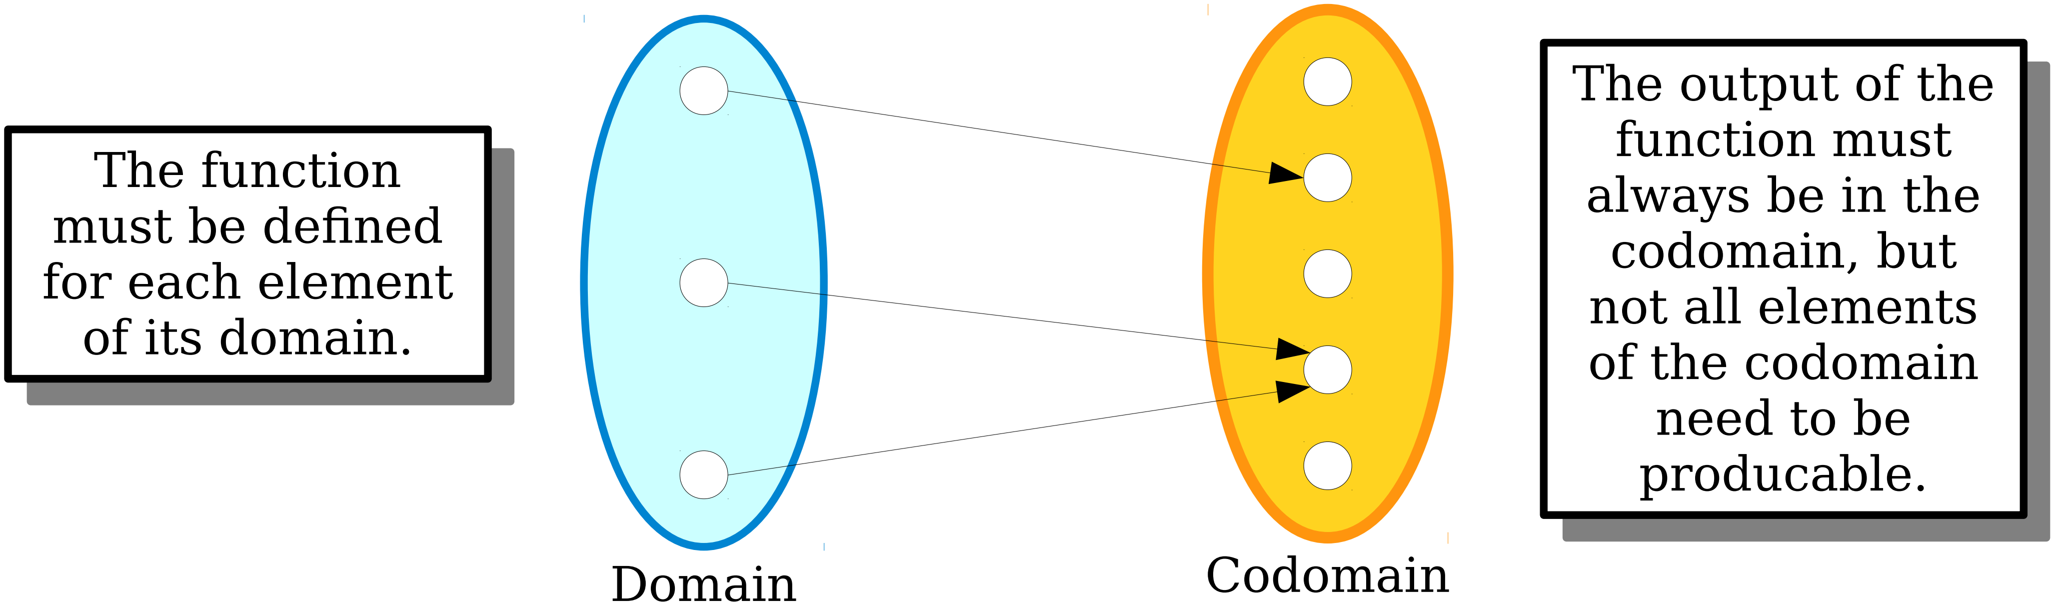
Cardinality

Recap from Last Time

Domains and Codomains

- Every function f has two sets associated with it: its ***domain*** and its ***codomain***.
- A function f can only be applied to elements of its domain. For any x in the domain, $f(x)$ belongs to the codomain.
- We write $\boldsymbol{f : A \to B}$ to indicate that f is a function whose domain is A and whose codomain is B.



Function Composition

- If $f : A \to B$ and $g : B \to C$ are functions, the ***composition of f and g***, denoted $g \circ f$, is a function
  - whose domain is A,
  - whose codomain is C, and
  - which is evaluated as $(g \circ f)(x) = g(f(x))$.

Injective Functions

- A function $f : A \to B$ is called ***injective*** (or ***one-to-one***) if each element of the codomain has at most one element of the domain that maps to it.
  - A function with this property is called an ***injection***.
- Formally, $f : A \to B$ is an injection if this FOL statement is true:

$$\forall a_1 \in A.\ \forall a_2 \in A.\ (a_1 \neq a_2 \to f(a_1) \neq f(a_2))$$

(*"If the inputs are different, the outputs are different"*)

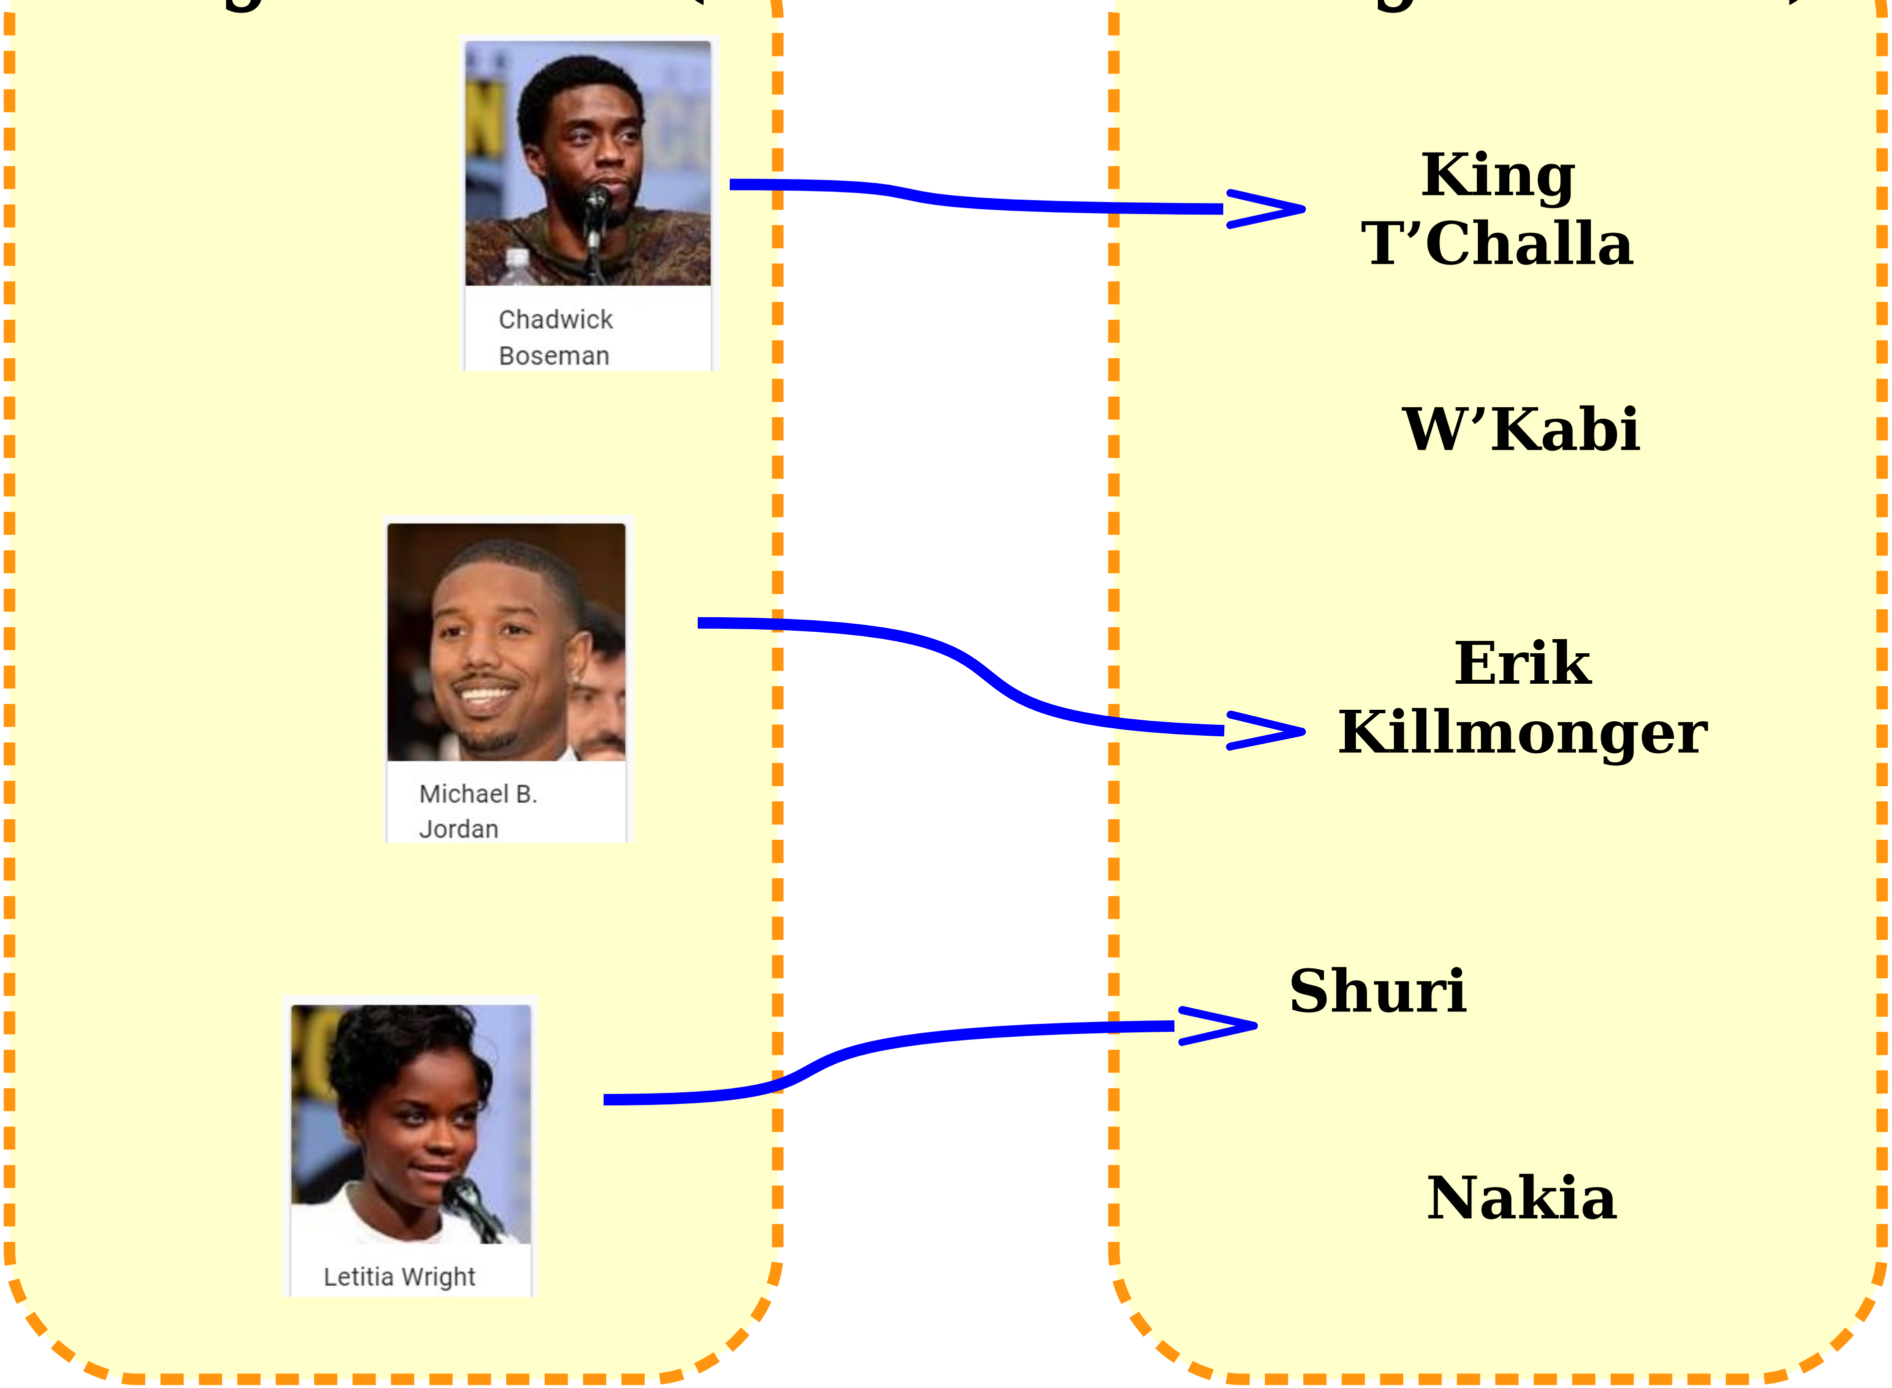
- Equivalently:

$$\forall a_1 \in A.\ \forall a_2 \in A.\ (f(a_1) = f(a_2) \to a_1 = a_2)$$

(*"If the outputs are the same, the inputs are the same"*)

- ***Theorem:*** The composition of two injections is an injection.

Injective (but not Surjective)



Surjective Functions

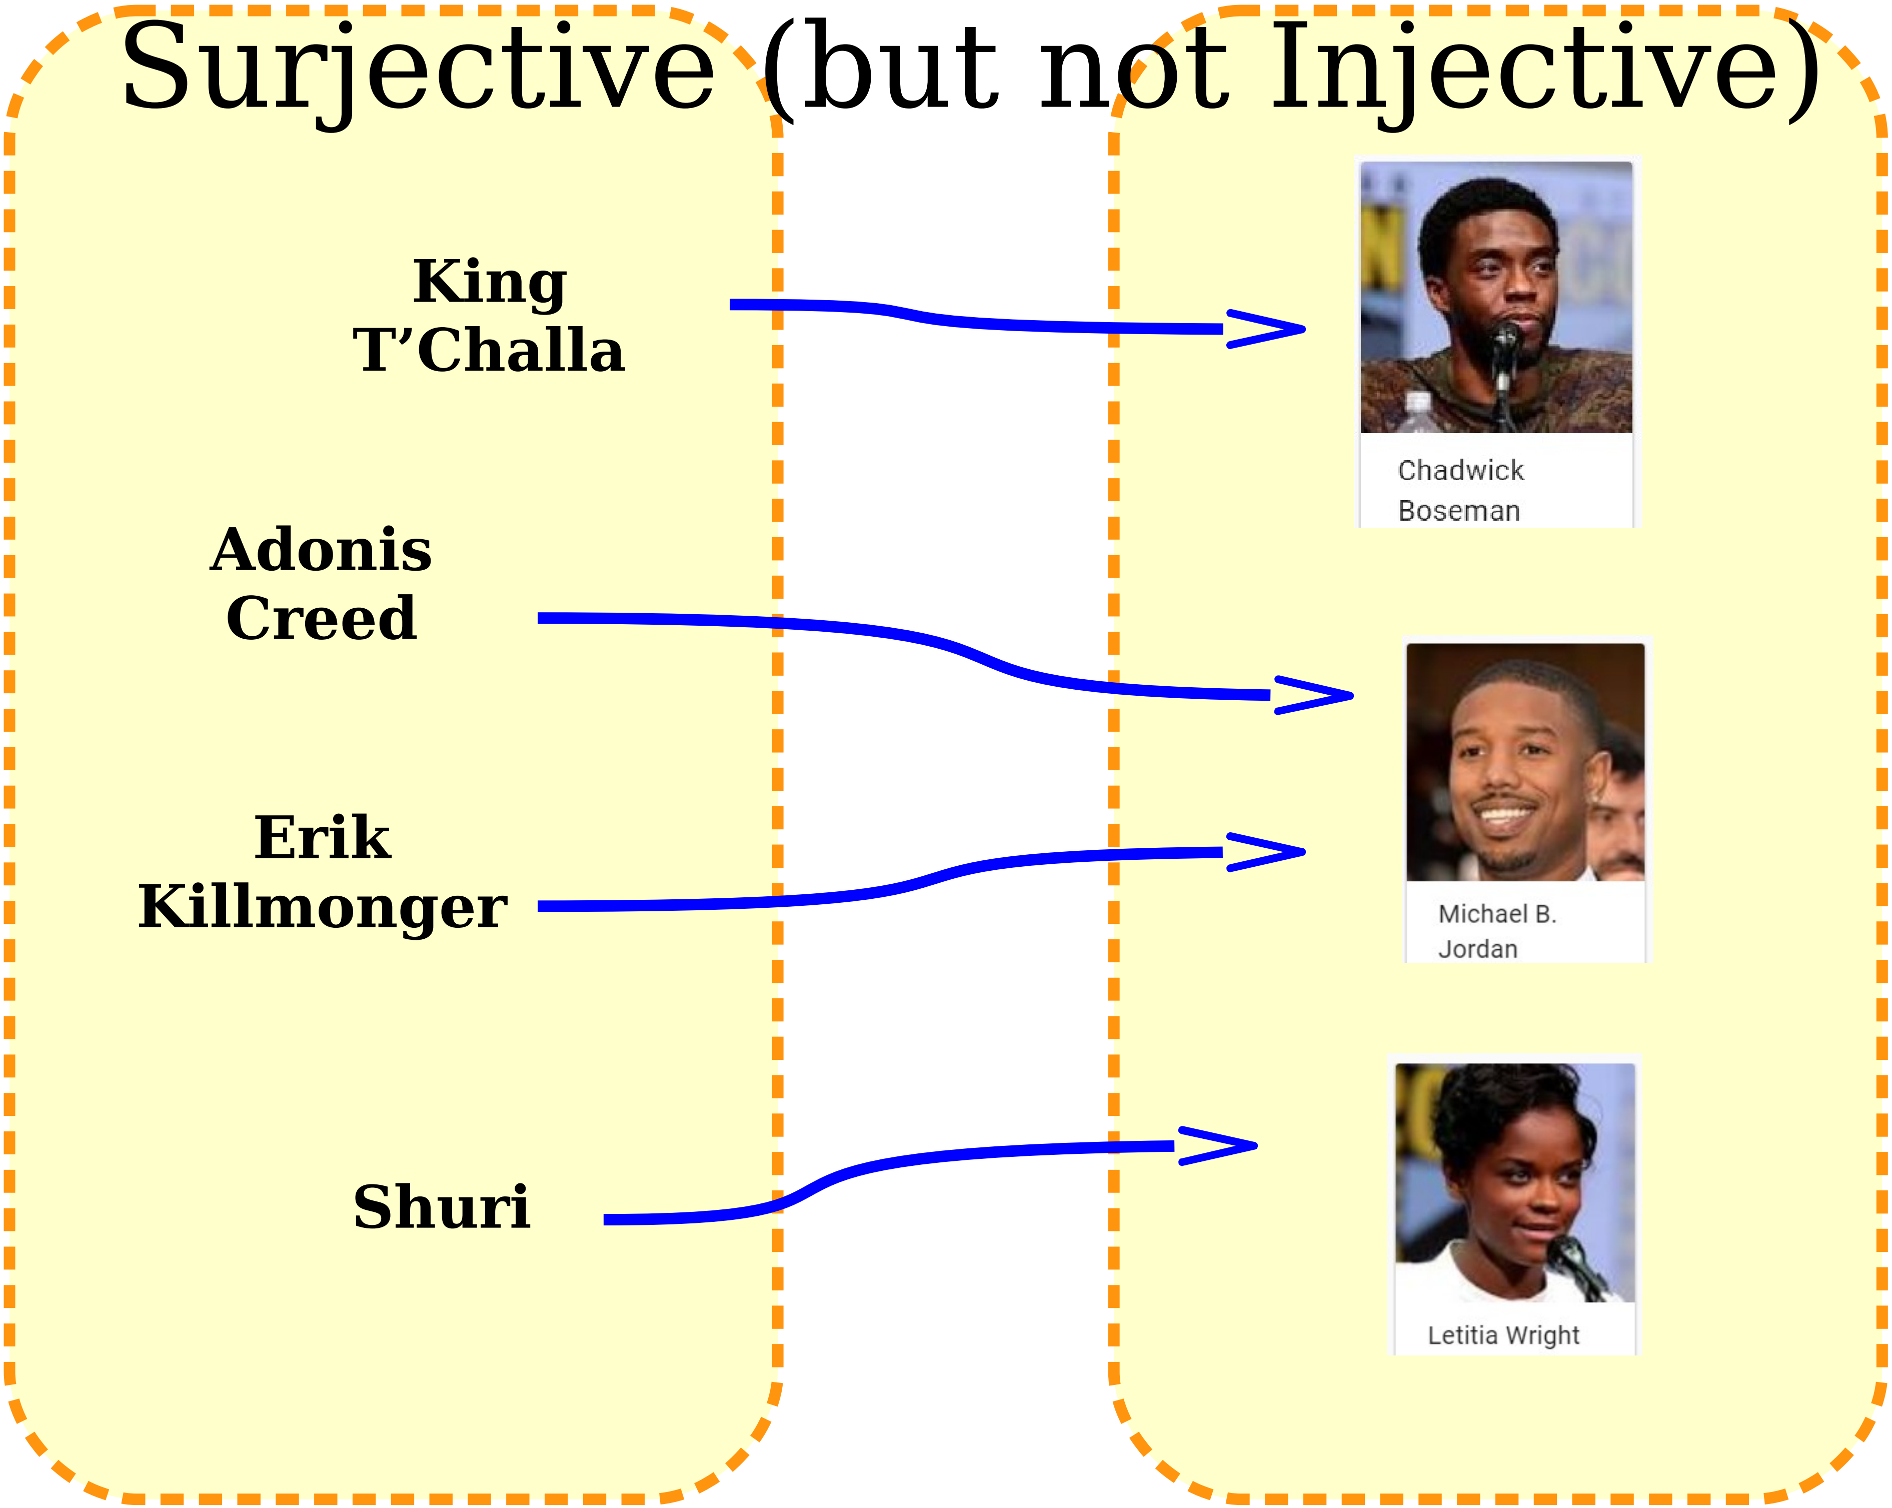
- A function $f : A \to B$ is called ***surjective*** (or ***onto***) if each element of the codomain is "covered" by at least one element of the domain.
  - A function with this property is called a ***surjection***.
- Formally, $f : A \to B$ is a surjection if this FOL statement is true:

$$\forall b \in B.\ \exists a \in A.\ f(a) = b$$

(*"For every possible output, there's at least one possible input that produces it"*)

- ***Theorem:*** The composition of two surjections is a surjection.

Surjective (but not Injective)



Bijections

- A function that associates each element of the codomain with a unique element of the domain is called ***bijective***.
  - Such a function is a ***bijection***.
- Formally, a bijection is a function that is both *injective* and *surjective*.
- ***Theorem:*** The composition of two bijections is a bijection.

Where We Are

- We now know
  - what an injection, surjection, and bijection are;
  - that the composition of two injections, surjections, or bijections is also an injection, surjection, or bijection, respectively; and
  - that bijections are invertible and invertible functions are bijections.
- You might wonder why this all matters. Well, there's a good reason…

New Stuff!

Cardinality Revisited

Cardinality

- Recall *(from our first lecture!)* that the ***cardinality*** of a set is the number of elements it contains.
- If S is a set, we denote its cardinality by $|S|$.
- For finite sets, cardinalities are natural numbers:
  - $|\{1, 2, 3\}| = 3$
  - $|\{100, 200\}| = 2$
- For infinite sets, we introduced ***infinite cardinals*** to denote the size of sets:

$$|\mathbb{N}| = \aleph_0$$

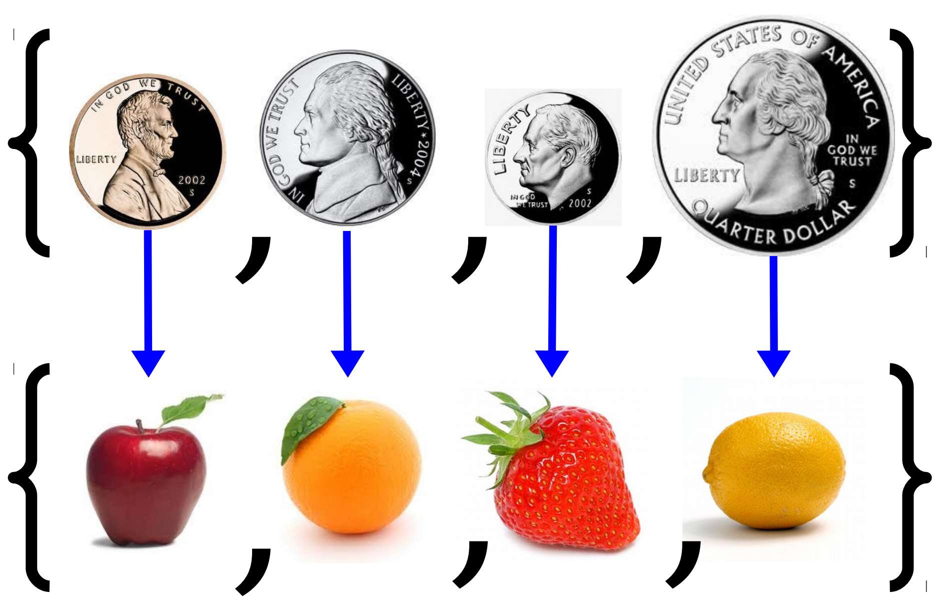
Defining Cardinality

- It is difficult to give a rigorous definition of what cardinalities actually are.
  - What is 4? What is $\aleph_0$?
  - (Take Math 161 for an answer!)
- ***Idea:*** Define cardinality as a *relation* between two sets rather than an absolute quantity.

Comparing Cardinalities

- Here is the formal definition of what it means for two sets to have the same cardinality:

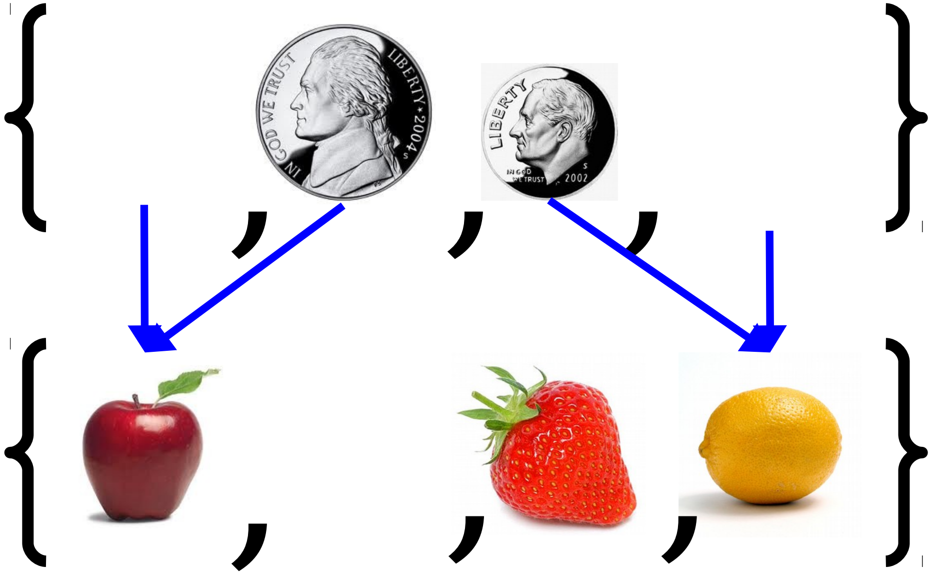
$|S| = |T|$ if there exists a *bijection* $f : S \to T$



Comparing Cardinalities

- Here is the formal definition of what it means for two sets to have the same cardinality:

$|S| = |T|$ if there exists a *bijection* $f : S \to T$



Fun with Cardinality

Terminology Refresher

- Let a and b be real numbers where $a \leq b$.
- The notation $\mathbf{[a, b]}$ denotes the set of all real numbers between a and b, inclusive.

$$[a, b] = \{ x \in \mathbb{R} \mid a \leq x \leq b \}$$

- The notation $\mathbf{(a, b)}$ denotes the set of all real numbers between a and b, exclusive.

$$(a, b) = \{ x \in \mathbb{R} \mid a \leq x \leq b \}$$

$$f : [0, 1] \to [0, 2]$$

$$f(x) = 2x$$

Theorem: $|[0, 1]| = |[0, 2]|$

Theorem: $|[0, 1]| = |[0, 2]|$

Proof:

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$.

How many of the following are proper ways of
setting up the next part of this proof?

Choose any $x \in [0, 1]$. We will show there is a $y \in [0, 2]$ such that $f(x) = y$.

Pick any $y \in [0, 2]$. We will show there is an $x \in [0, 1]$ where $f(x) = y$.

Assume for the sake of contradiction that, for any $y \in [0, 2]$ and for any $x \in [0, 1]$, we have $f(x) \neq y$.

Finally, we will show that f is surjective.

Answer at **PollEv.com/cs103** or
text **CS103** to **22333** once to join, then a number between **0** and **3**.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq {}^{y}/_{2} \leq 1$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq {}^{y}/_{2} \leq 1$. We picked $x = {}^{y}/_{2}$, so we know that $0 \leq x \leq 1$, which in turn means $x \in [0, 1]$.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq {}^{y}/_{2} \leq 1$. We picked $x = {}^{y}/_{2}$, so we know that $0 \leq x \leq 1$, which in turn means $x \in [0, 1]$. Moreover, notice that

$$f(x) = 2x$$

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \le x \le 1$, so we know that $0 \le 2x \le 2$. Consequently, we see that $0 \le f(x) \le 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \le y \le 2$, and therefore that $0 \le {}^{y}/_{2} \le 1$. We picked $x = {}^{y}/_{2}$, so we know that $0 \le x \le 1$, which in turn means $x \in [0, 1]$. Moreover, notice that

$$f(x) = 2x = 2({}^{y}/_{2})$$

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = y/2$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq y/2 \leq 1$. We picked $x = y/2$, so we know that $0 \leq x \leq 1$, which in turn means $x \in [0, 1]$. Moreover, notice that

$$f(x) = 2x = 2(y/2) = y$$

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq {}^{y}/_{2} \leq 1$. We picked $x = {}^{y}/_{2}$, so we know that $0 \leq x \leq 1$, which in turn means $x \in [0, 1]$. Moreover, notice that

$$f(x) = 2x = 2({}^{y}/_{2}) = y,$$

so $f(x) = y$, as required.

Theorem: $|[0, 1]| = |[0, 2]|$

Proof: Consider the function $f : [0, 1] \to [0, 2]$ defined as $f(x) = 2x$. We will prove that f is a bijection.

First, we will show that f is a well-defined function. Choose any $x \in [0, 1]$. This means that $0 \leq x \leq 1$, so we know that $0 \leq 2x \leq 2$. Consequently, we see that $0 \leq f(x) \leq 2$, so $f(x) \in [0, 2]$.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in [0, 1]$ where $f(x_1) = f(x_2)$. We will show that $x_1 = x_2$. To see this, notice that since $f(x_1) = f(x_2)$, we see that $2x_1 = 2x_2$, which in turn tells us that $x_1 = x_2$, as required.

Finally, we will show that f is surjective. To do so, consider any $y \in [0, 2]$. We'll show that there is some $x \in [0, 1]$ where $f(x) = y$.

Let $x = {}^{y}/_{2}$. Since $y \in [0, 2]$, we know $0 \leq y \leq 2$, and therefore that $0 \leq {}^{y}/_{2} \leq 1$. We picked $x = {}^{y}/_{2}$, so we know that $0 \leq x \leq 1$, which in turn means $x \in [0, 1]$. Moreover, notice that

$$f(x) = 2x = 2({}^{y}/_{2}) = y,$$

so $f(x) = y$, as required. ■

Home on the Range

$$f : [0, 1] \to [0, 2]$$

$$f(x) = 2x$$

Home on the Range

$$\boldsymbol{f : [0, 1] \to [0, 3]}$$
$$\boldsymbol{f(x) = 3x}$$

Home on the Range

$$\boldsymbol{f : [0, 1] \to [0, 137]}$$
$$\boldsymbol{f(x) = 137x}$$

Home on the Range

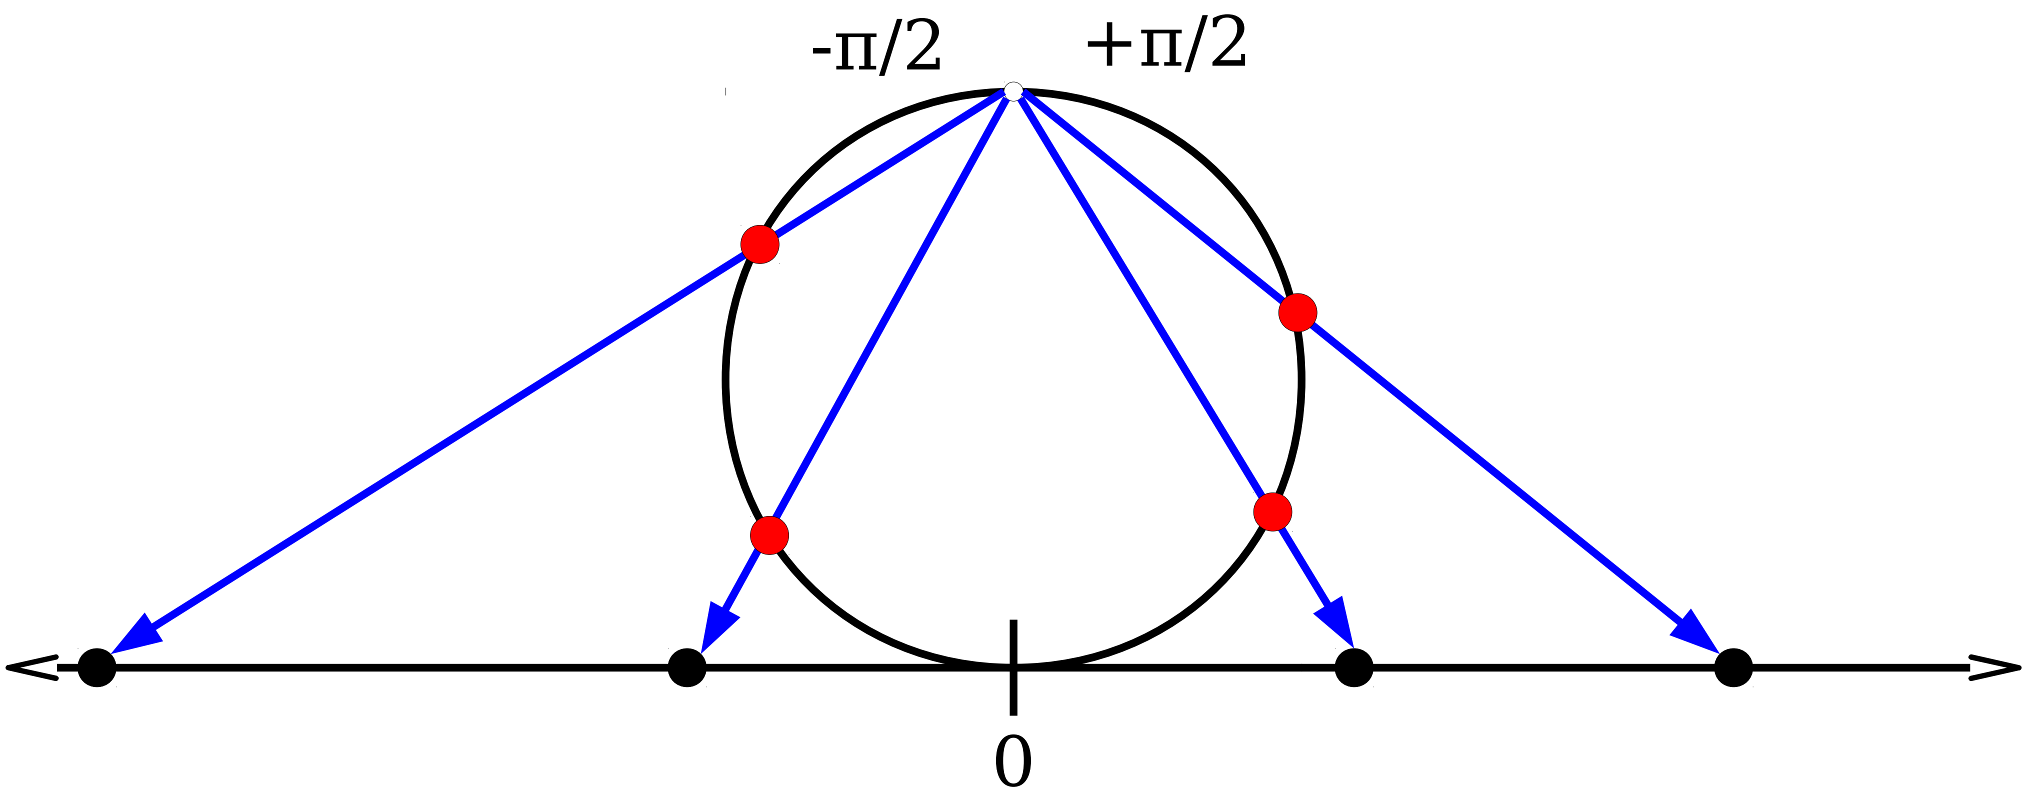
(for any $k > 0$)

$$f : [0, 1] \to [0, k]$$
$$f(x) = kx$$

This means that ***cardinality*** (how many points there are) is a different idea than ***mass*** (how much those points weight). Look into ***measure theory*** if you're curious to learn more!

And one more example, just for funzies.

Put a Ring On It



$$f : (-\pi/2, \pi/2) \to \mathbb{R}$$

$$f(x) = \tan x$$

$$|(-\pi/2, \pi/2)| = |\mathbb{R}|$$

Some Properties of Cardinality

Theorem: For any set A, we have $|A| = |A|$.

Theorem: For any set A, we have $|A| = |A|$.

Proof:

Which of the following is the right high-level way to approach this proof?

A. Pick an arbitrary set A, then find a bijection $f : A \to A$.
B. Pick an arbitrary set A and show every function $f : A \to A$ is bijective.
C. There's nothing to prove here. Every object is equal to itself.

Answer at **PollEv.com/cs103** or
text **CS103** to **22333** once to join, then ***A***, ***B***, or ***C***.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Finally, we'll show that f is surjective.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Finally, we'll show that f is surjective. Consider any $y \in A$.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Finally, we'll show that f is surjective. Consider any $y \in A$. We will prove that there is some $x \in A$ where $f(x) = y$.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Finally, we'll show that f is surjective. Consider any $y \in A$. We will prove that there is some $x \in A$ where $f(x) = y$. Pick $x = y$.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

First, we'll show that f is a well-defined function. To see this, note that for any $x \in A$, we have $f(x) = x \in A$, as needed.

Next, we'll show that f is injective. Pick any $x_1, x_2 \in A$ where $f(x_1) = f(x_2)$. We need to show that $x_1 = x_2$. Since $f(x_1) = f(x_2)$, we see by definition of f that $x_1 = x_2$, as required.

Finally, we'll show that f is surjective. Consider any $y \in A$. We will prove that there is some $x \in A$ where $f(x) = y$. Pick $x = y$. Then $x \in A$ (since $y \in A$) and $f(x) = x = y$, as required.

Theorem: For any set A, we have $|A| = |A|$.

Proof: Consider any set A, and let $f : A \to A$ be the function defined as $f(x) = x$. We will prove that f is a bijection.

Finally, we'll show that f is surjective. Consider any $y \in A$. We will prove that there is some $x \in A$ where $f(x) = y$. Pick $x = y$. Then $x \in A$ (since $y \in A$) and $f(x) = x = y$, as required. ■

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof:

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$. Similarly, since $|B| = |C|$ we know that there is at least one bijection $g : B \to C$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$. Similarly, since $|B| = |C|$ we know that there is at least one bijection $g : B \to C$.

Consider the function $g \circ f : A \to C$.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$. Similarly, since $|B| = |C|$ we know that there is at least one bijection $g : B \to C$.

Consider the function $g \circ f : A \to C$. Since g and f are bijections and the composition of two bijections is a bijection, we see that $g \circ f$ is a bijection from A to C.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$. Similarly, since $|B| = |C|$ we know that there is at least one bijection $g : B \to C$.

Consider the function $g \circ f : A \to C$. Since g and f are bijections and the composition of two bijections is a bijection, we see that $g \circ f$ is a bijection from A to C. Thus $|A| = |C|$, as required.

Theorem: If A, B, and C are sets where $|A| = |B|$ and $|B| = |C|$, then $|A| = |C|$.

Proof: Consider any sets A, B, and C where $|A| = |B|$ and $|B| = |C|$. We need to prove that $|A| = |C|$. To do so, we need to show that there is a bijection from A to C.

Since $|A| = |B|$, we know that there is a some bijection $f : A \to B$. Similarly, since $|B| = |C|$ we know that there is at least one bijection $g : B \to C$.

Consider the function $g \circ f : A \to C$. Since g and f are bijections and the composition of two bijections is a bijection, we see that $g \circ f$ is a bijection from A to C. Thus $|A| = |C|$, as required. ■

Great exercise: Prove that if A and B are sets where $|A| = |B|$, then $|B| = |A|$.

Unequal Cardinalities

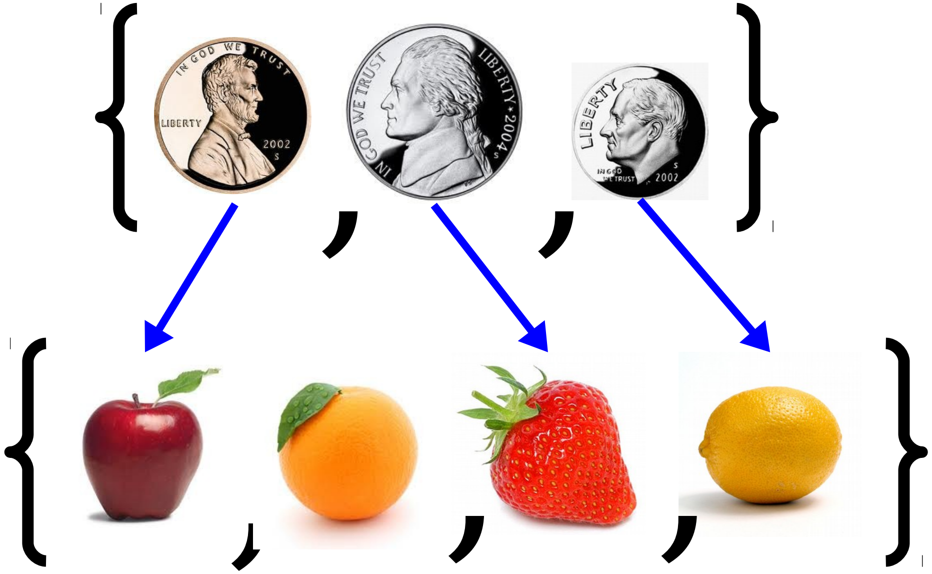
- Recall: $|A| = |B|$ if the following statement is true:

There exists a bijection $f : A \to B$

- What does it mean for $|A| \neq |B|$ to be true?

Every function $f : A \to B$ is not a bijection.

- This is a strong statement! To prove $|A| \neq |B|$, we need to show that *no possible function* from A to B can be injective and surjective.



Unequal Cardinalities

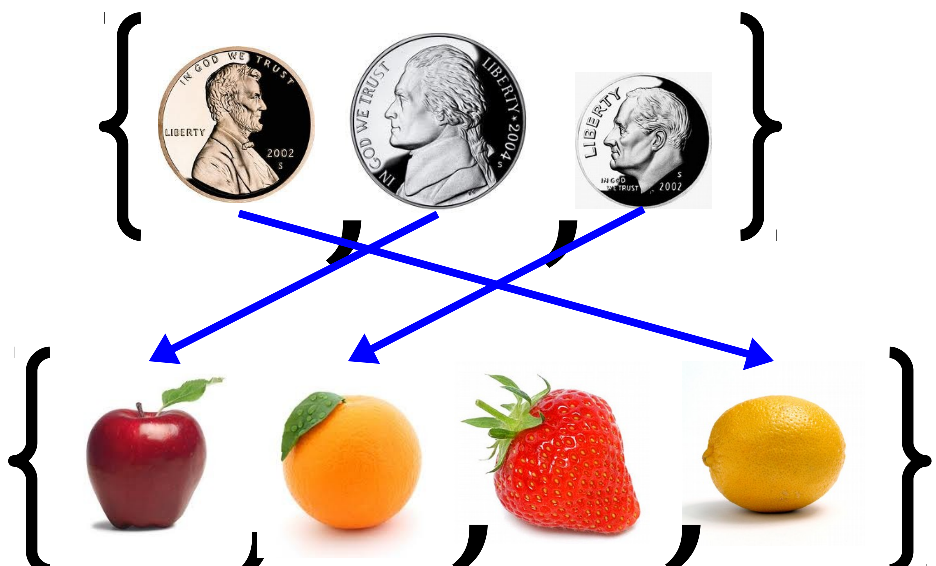
- Recall: $|A| = |B|$ if the following statement is true:

There exists a bijection $f : A \to B$

- What does it mean for $|A| \neq |B|$ to be true?

Every function $f : A \to B$ is not a bijection.

- This is a strong statement! To prove $|A| \neq |\mathrm{B}|$, we need to show that *no possible function* from A to B can be injective and surjective.



Unequal Cardinalities

- Recall: $|A| = |B|$ if the following statement is true:

There exists a bijection $f : A \to B$

- What does it mean for $|A| \neq |B|$ to be true?

Every function $f : A \to B$ is not a bijection.

- This is a strong statement! To prove $|A| \neq |B|$, we need to show that *no possible function* from A to B can be injective and surjective.

Cantor's Theorem Revisited

Cantor's Theorem

- In our very first lecture, we sketched out a proof of ***Cantor's theorem***, which says that

If S is a set, then $|S| < |\wp(S)|$.

- That proof was visual and pretty hand-wavy. Let's see if we can go back and formalize it!

Where We're Going

- Today, we're going to formally prove the following result:

If S is a set, then $|S| \neq |\wp(S)|$.

- We've released an online Guide to Cantor's Theorem, which will go into *way* more depth than what we're going to see here.
- The goal for today will be to see how to start with our picture and turn it into something rigorous.
- On the next problem set, you'll explore the proof in more depth and see some other applications.

The Roadmap

- We're going to prove this statement:

$$\text{If } S \text{ is a set, then } |S| \neq |\wp(S)|.$$

- Here's how this will work:
  - Pick an arbitrary set S.
  - Pick an arbitrary function $f : S \to \wp(S)$.
  - Show that f is not surjective using a diagonal argument.
  - Conclude that there are no bijections from S to $\wp(S)$.
  - Conclude that $|S| \neq |\wp(S)|$.

The Roadmap

We're going to prove this statement:

$$\text{If } S \text{ is a set, then } |S| \neq |\wp(S)|.$$

Here's how this will work:

- Pick an arbitrary set S.
- Pick an arbitrary function $f : S \to \wp(S)$.
- Show that f is not surjective using a diagonal argument.
- Conclude that there are no bijections from S to $\wp(S)$.
- Conclude that $|S| \neq |\wp(S)|$.

The Diagonal Set

- For any set S and function $f : S \to \wp(S)$, we can define a set D as follows:

$$D = \{ x \in S \mid x \notin f(x) \}$$

("The set of all elements x where x is not an element of the set f(x).")

- This is a formalization of the set we found in the previous picture.
- Using this choice of D, we can formally prove that no function $f : S \to \wp(S)$ is a bijection.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set. We will prove that $|S| \neq |\wp(S)|$ by showing that there are no bijections from S to $\wp(S)$.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set. We will prove that $|S| \neq |\wp(S)|$ by showing that there are no bijections from S to $\wp(S)$. To do so, choose an arbitrary function $f : S \to \wp(S)$.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set. We will prove that $|S| \neq |\wp(S)|$ by showing that there are no bijections from S to $\wp(S)$. To do so, choose an arbitrary function $f : S \to \wp(S)$. We will prove that f is not surjective.

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set. We will prove that $|S| \neq |\wp(S)|$ by showing that there are no bijections from S to $\wp(S)$. To do so, choose an arbitrary function $f : S \to \wp(S)$. We will prove that f is not surjective.

Starting with f, we define the set

$$D = \{ \ x \in S \mid x \notin f(x) \ \}. \qquad (1)$$

Theorem: If S is a set, then $|S| \neq |\wp(S)|$.

Proof: Let S be an arbitrary set. We will prove that $|S| \neq |\wp(S)|$ by showing that there are no bijections from S to $\wp(S)$. To do so, choose an arbitrary function $f : S \to \wp(S)$. We will prove that f is not surjective.

Starting with f, we define the set

$$D = \{ \ x \in S \mid x \notin f(x) \ \}. \tag{1}$$

We will show that there is no $y \in S$ such that $f(y) = D$.

This means that f is not a bijection, and since our choice of f was arbitrary, we conclude that there are no bijections between S and $\wp(S)$. Thus $|S| \neq |\wp(S)|$, as required. ■

The Big Recap

- We define equal cardinality in terms of bijections between sets.
- Lots of different sets of infinite size have the same cardinality.
- Cardinality acts like an equivalence relation – but only because we can prove specific properties of how it behaves by relying on properties of function.
- Cantor's theorem can be formalized in terms of surjectivity.
