

Finite Automata

Part Three

Recap from Last Time

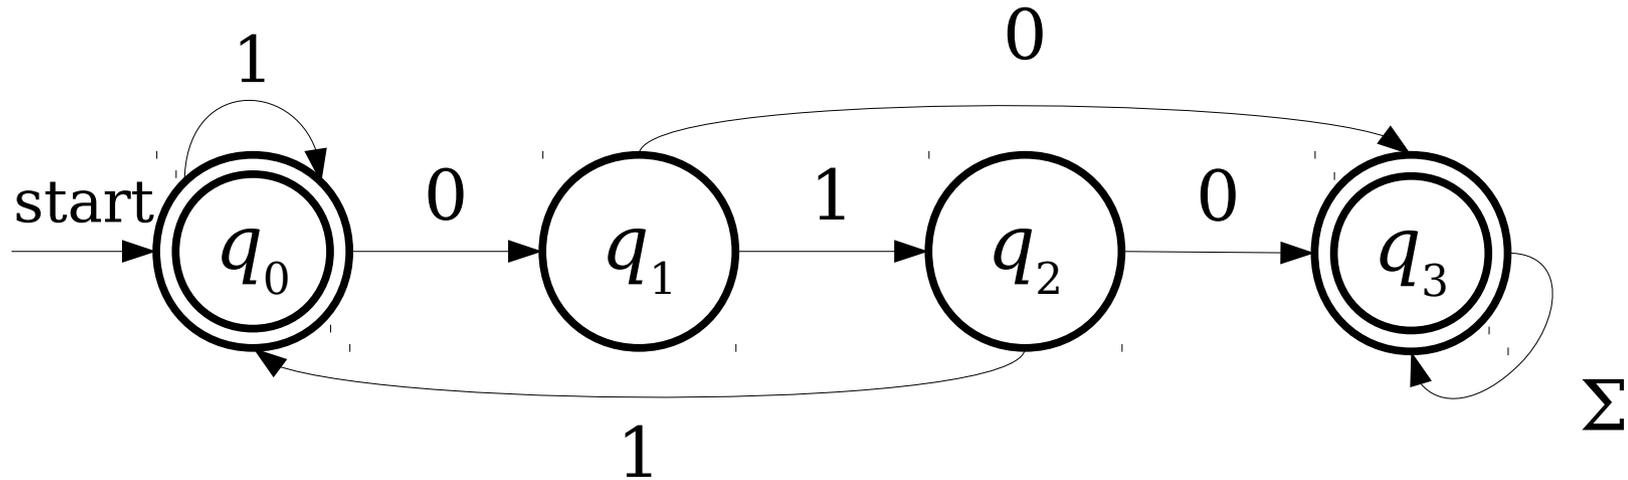

Tabular DFAs

	0	1
* q_0	q_1	q_0
q_1	q_3	q_2
q_2	q_3	q_0
* q_3	q_3	q_3

These stars indicate accepting states.

Tabular DFAs

Since this is the first row, it's the start state.

	0	1
* q_0	q_1	q_0
q_1	q_3	q_2
q_2	q_3	q_0
* q_3	q_3	q_3

If D is a DFA, the **language of D** , denoted $\mathcal{L}(D)$, is $\{ w \in \Sigma^* \mid D \text{ accepts } w \}$.

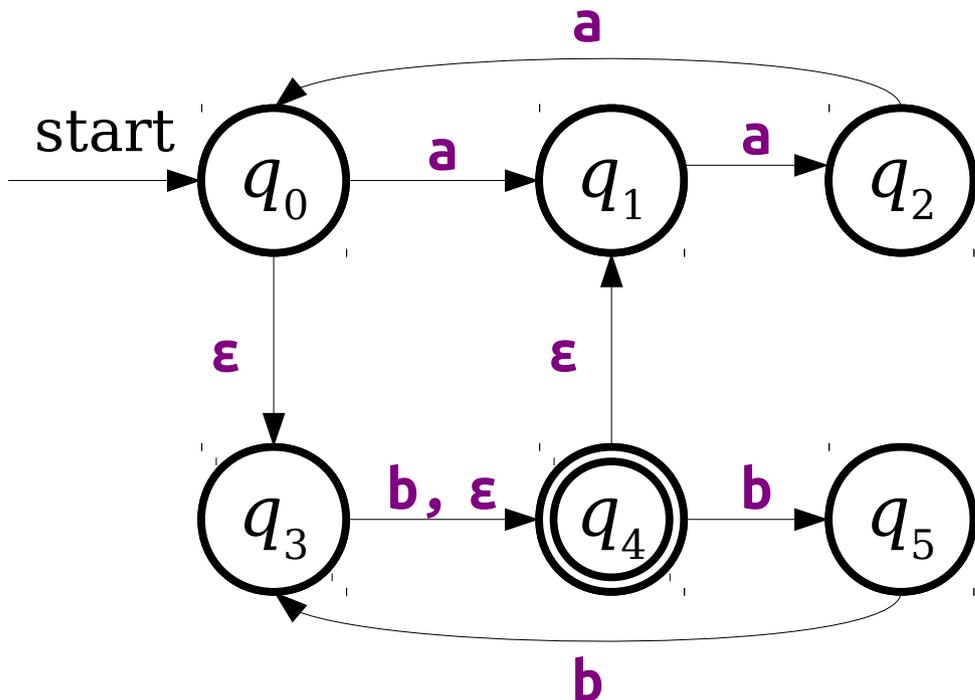

A language L is called a **regular language** if there exists a DFA D such that $\mathcal{L}(D) = L$.

NFAs

- An **NFA** is a
 - **N**ondeterministic
 - **F**inite
 - **A**utomaton
- Can have missing transitions or multiple transitions defined on the same input symbol.
- Accepts if *any possible series of choices* leads to an accepting state.

ϵ -Transitions

- NFAs have a special type of transition called the **ϵ -transition**.
- An NFA may follow any number of ϵ -transitions at any time without consuming any input.

Massive Parallelism

- An NFA can be thought of as a DFA that can be in many states at once.
- At each point in time, when the NFA needs to follow a transition, it tries all the options at the same time.
- The NFA accepts if *any* of the states that are active at the end are accepting states. It rejects otherwise.

Just how powerful *are* NFAs?

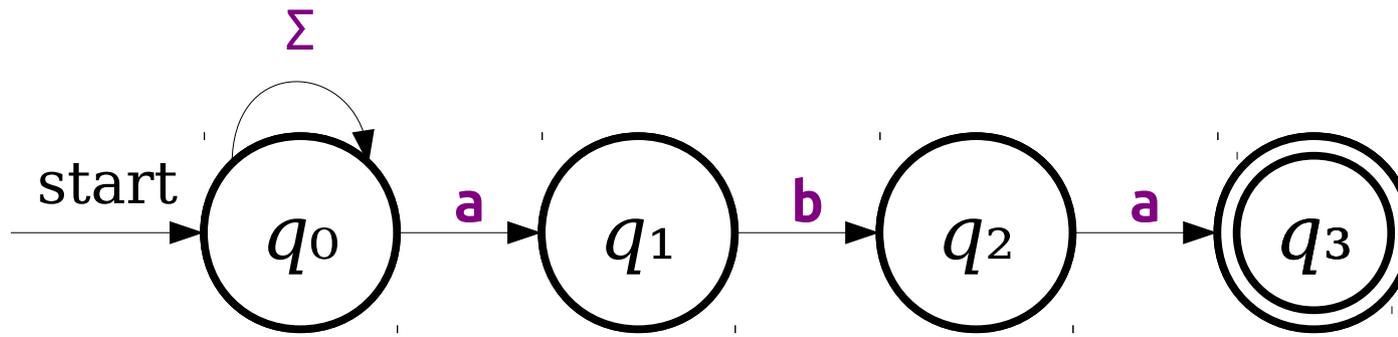

New Stuff!

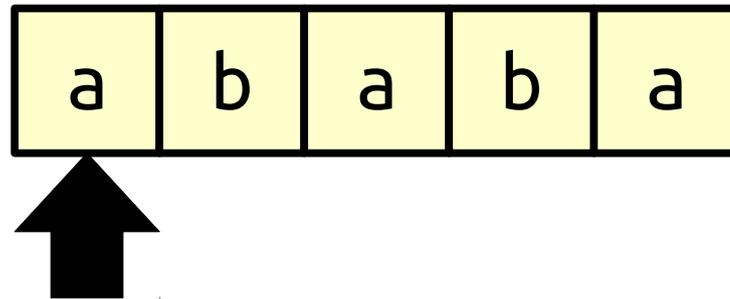

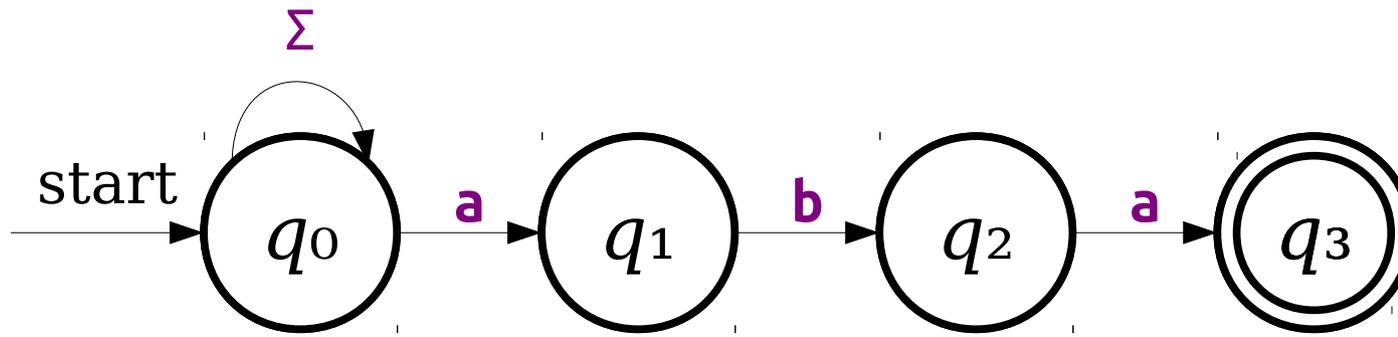

NFAs and DFAs

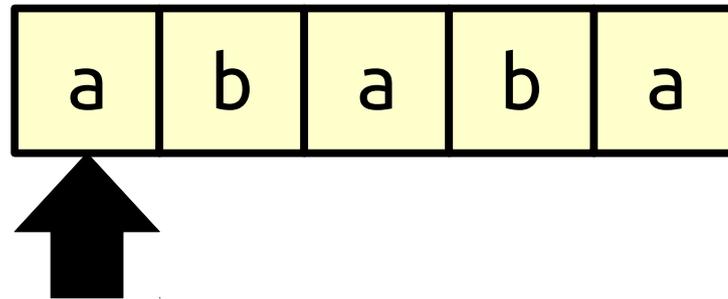

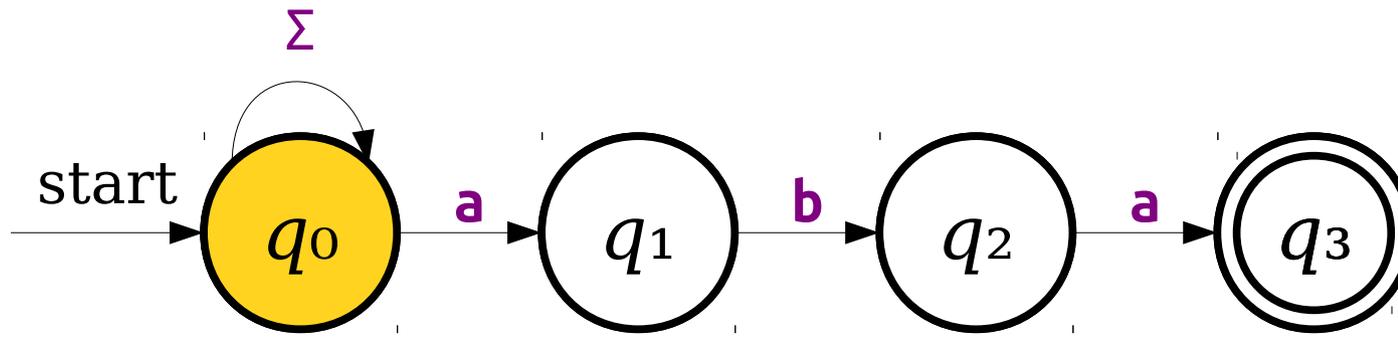

- Any language that can be accepted by a DFA can be accepted by an NFA.
- Why?
 - Every DFA essentially already *is* an NFA!
- **Question:** Can any language accepted by an NFA also be accepted by a DFA?
- Surprisingly, the answer is **yes!**

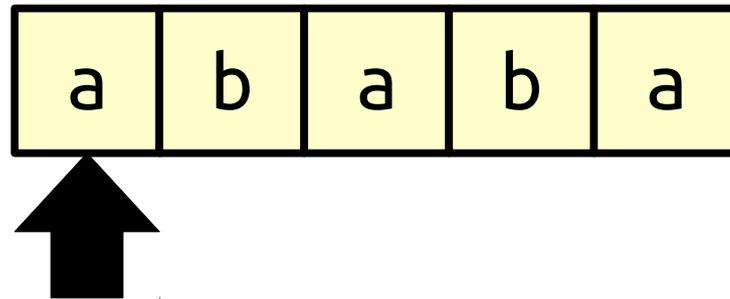

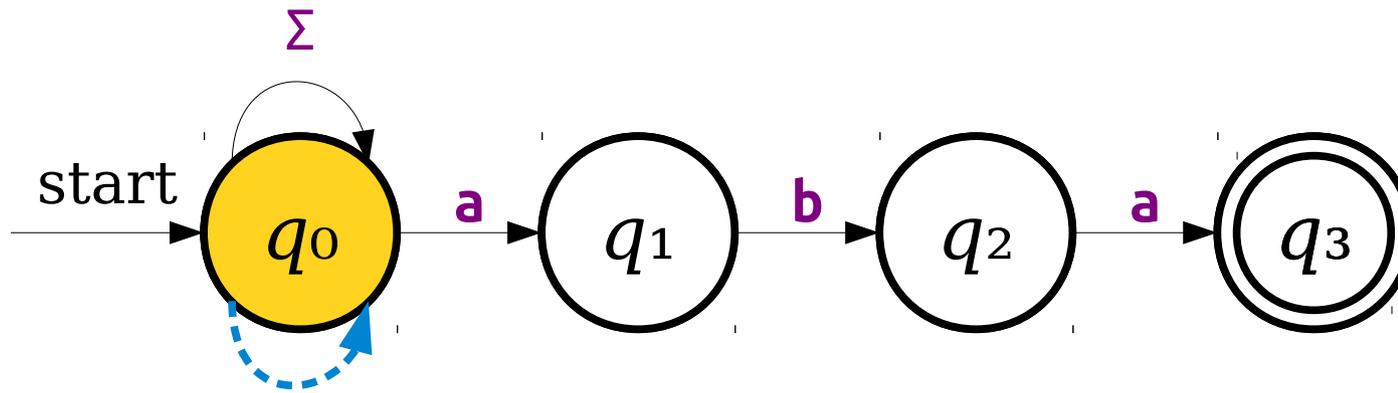

Thought Experiment:

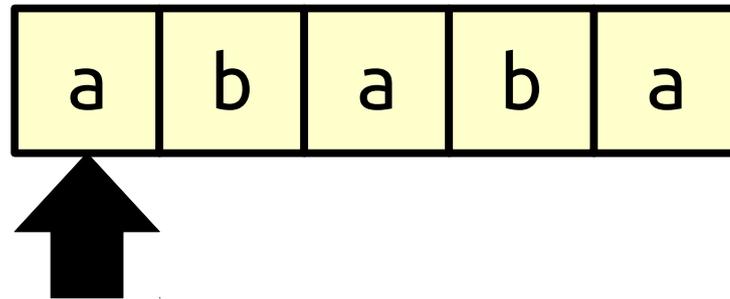

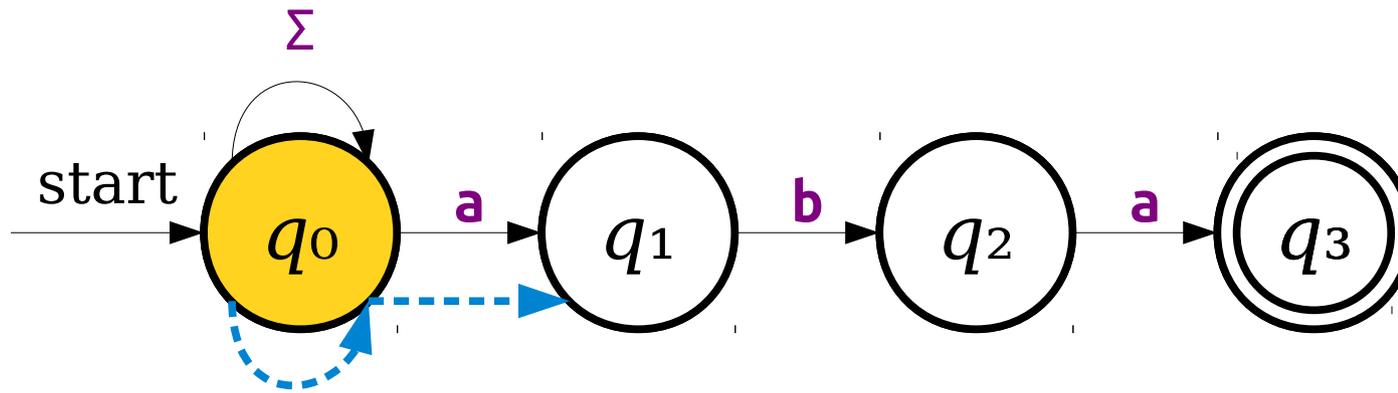

How would you simulate an NFA in software?

The Subset Construction

- This procedure for turning an NFA for a language L into a DFA for a language L is called the **subset construction**.
 - It's sometimes called the **powerset construction**; it's different names for the same thing!
- Intuitively:
 - Each state in the DFA corresponds to a set of states from the NFA.
 - Each transition in the DFA corresponds to what transitions would be taken in the NFA when using the massive parallel intuition.
 - The accepting states in the DFA correspond to which sets of states would be considered accepting in the NFA when using the massive parallel intuition.
- There's an online **Guide to the Subset Construction** with a more elaborate example involving ϵ -transitions and cases where the NFA dies; check that for more details.

The Subset Construction

- In converting an NFA to a DFA, the DFA's states correspond to sets of NFA states.
- **Useful fact:** $|\wp(S)| = 2^{|S|}$ for any finite set S .
- In the worst-case, the construction can result in a DFA that is *exponentially larger* than the original NFA.
- **Question to ponder:** Can you find a family of languages that have NFAs of size n , but no DFAs of size less than 2^n ?

A language L is called a ***regular language*** if there exists a DFA D such that $\mathcal{L}(D) = L$.

An Important Result

Theorem: A language L is regular if and only if there is some NFA N such that $\mathcal{L}(N) = L$.

Proof Sketch: Pick a language L . First, assume L is regular. That means there's a DFA D where $\mathcal{L}(D) = L$. Every DFA is “basically” an NFA, so there's an NFA (D) whose language is L .

Next, assume there's an NFA N such that $\mathcal{L}(N) = L$. Using the subset construction, we can build a DFA D where $\mathcal{L}(N) = \mathcal{L}(D)$. Then we have that $\mathcal{L}(D) = L$, so L is regular. ■-ish

Why This Matters

- We now have two perspectives on regular languages:
 - Regular languages are languages accepted by DFAs.
 - Regular languages are languages accepted by NFAs.
- We can now reason about the regular languages in two different ways.

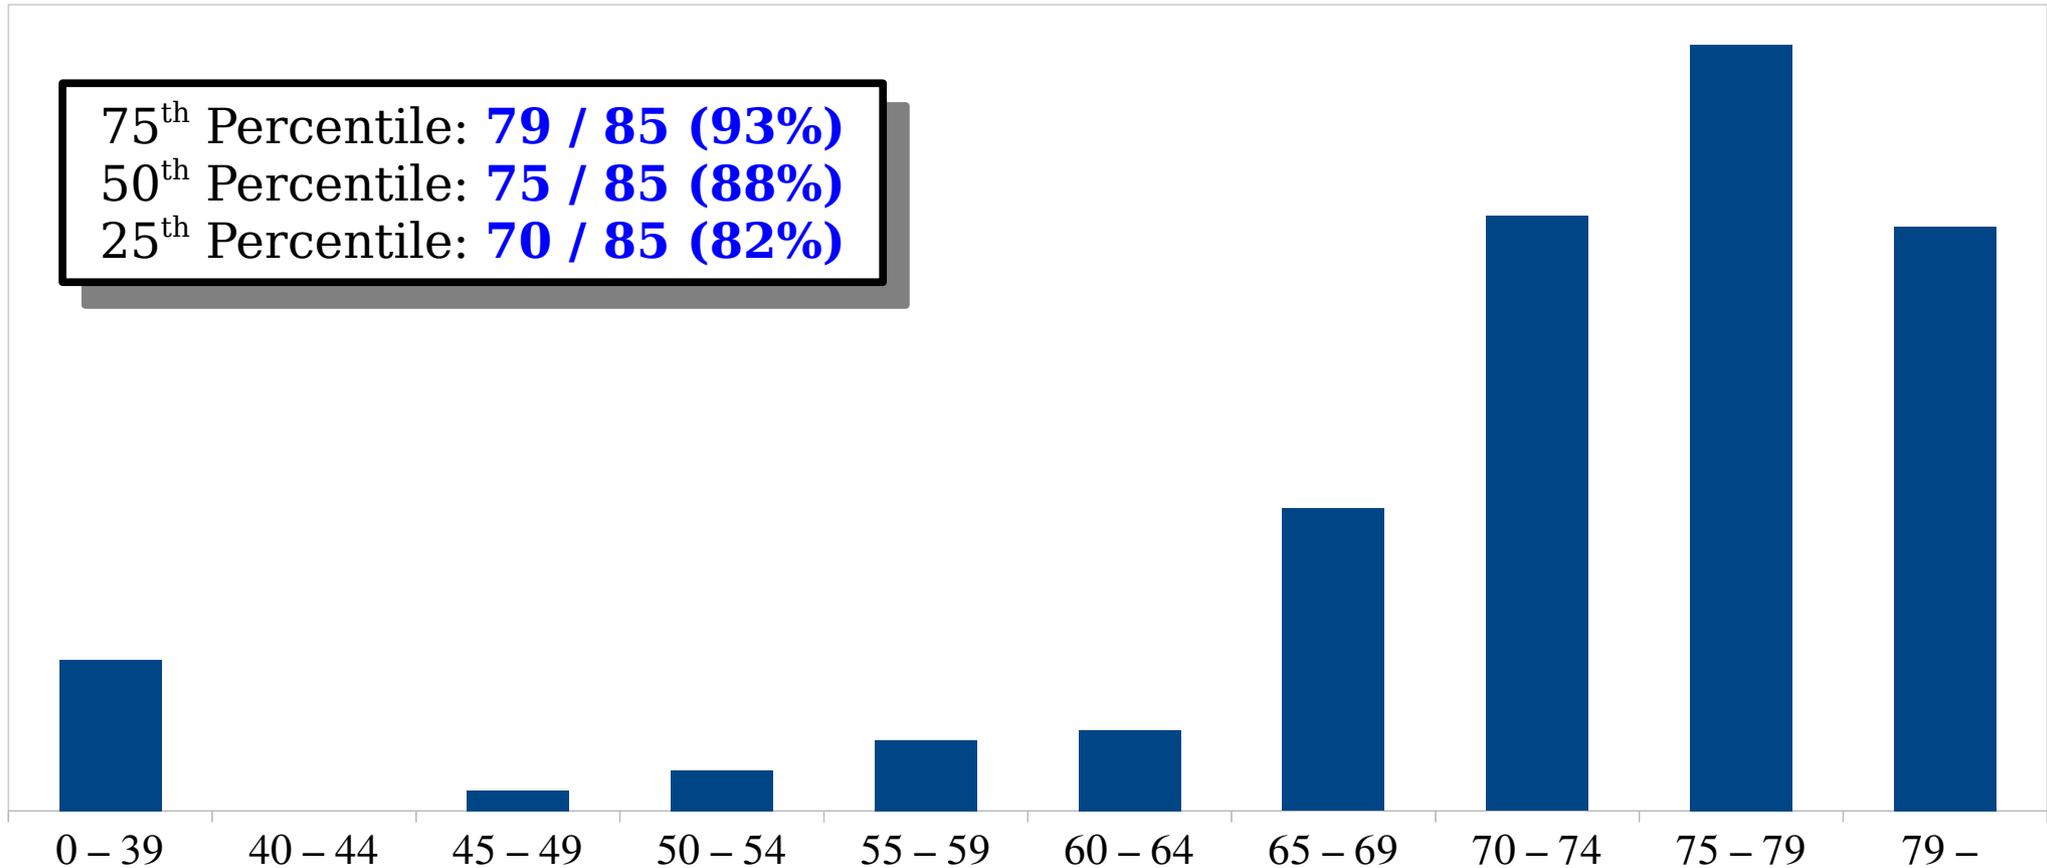

Time-Out for Announcements!

Problem Set Four Grades

75th Percentile: **79 / 85 (93%)**

50th Percentile: **75 / 85 (88%)**

25th Percentile: **70 / 85 (82%)**

Many of these grades are because folks forgot to list partners - please check to make sure you're getting credit for the work you're doing, and let us know if your partner forgot to add you.

Problem Set Six

- Problem Set Five was due at 2:30PM today.
 - Want to use late days? One late day will extend this deadline to 2:30PM Saturday, and a second will extend it to 2:30PM Sunday.
- Problem Set Six goes out today. It's due next Friday at 2:30PM.
 - Play around with DFAs, NFAs, language transformations, and their properties!
 - Explore how all the discrete math topics we've talked about so far come into play!

DFA/NFA Editor

- We have an online DFA/NFA editor you'll use to answer and submit some of the questions for PS6.
- This tool will let you design and test your automata on a number of different inputs.
- You can also use it to explore on your own!
- One quick note: unlike the previous coding questions, we will only run the autograder once the problem set comes due. As a result, ***make sure to test your solutions thoroughly before submitting!***
 - Think about edge cases. What are some small strings that might break things? Some longer strings?
 - Pretend you haven't looked at your automata and just saw the language itself. What would be cases you'd expect would be really tricky?

Looking for a Partner?

- I've heard from many of you that you're now looking for a problem set partner.
- Don't forget that Piazza has a lovely "Search for Teammates" feature that you can use to do this.
- It's like speed dating for theory!

Midterm Practice Problems

- If you'd like to get a jump on studying for the second midterm, feel free to work through the four practice exams we've posted to the course website.
- There's also Extra Practice Problems 2 to work through.
- We'll be holding a practice midterm exam **next Wednesday** evening from **7PM - 10PM**, location TBA. It'll use an exam that's not yet posted to the course website.

Your Questions

“How can you "differentiate" yourself as a programmer? Especially, at Stanford since you are one out of so many.”

My first question is why you'd want to differentiate yourself as a programmer – that's not something you necessarily need to do at this point. I'd focus a lot more on skill acquisition and on finding what makes you happy before worrying about this. There aren't many times where you need to "stand out" of the crowd as a programmer, and most of them will arise because you're competent, talented, and easy to work with.

Your personal identity doesn't have to be tied to your coding skills. You're a whole person and these skills are just a part of that.

“Why do you like the number 137 so much?”

It's the reciprocal of the fine structure constant, rounded to the nearest integer. It's also a great “nothing-up-my-sleeve” number.

Back to CS103!

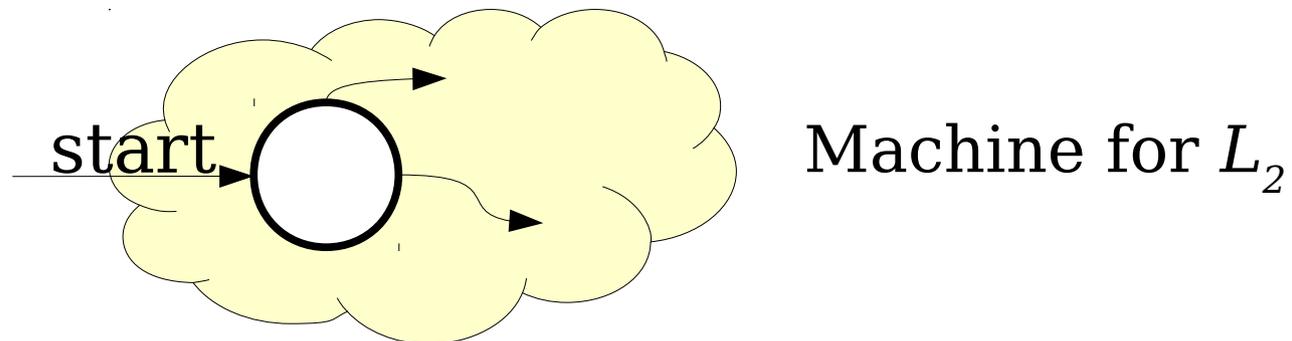

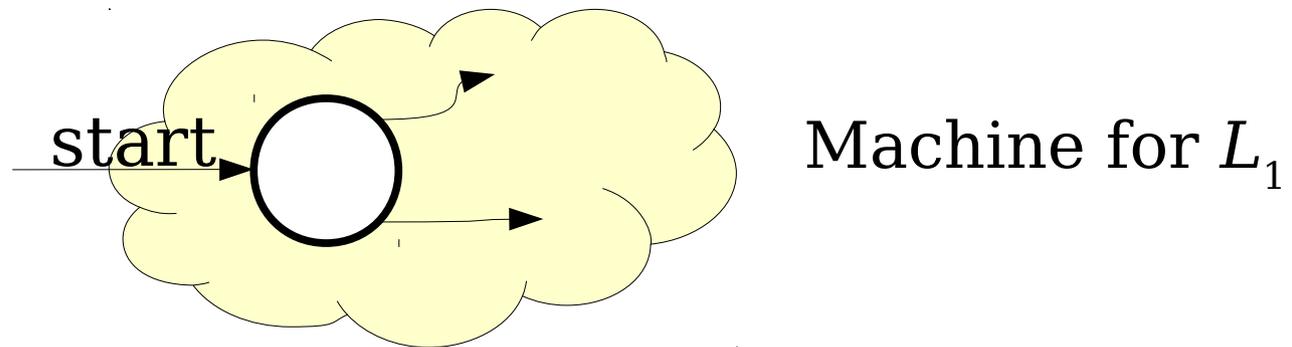

Properties of Regular Languages

The Union of Two Languages

- If L_1 and L_2 are languages over the alphabet Σ , the language $L_1 \cup L_2$ is the language of all strings in at least one of the two languages.
- If L_1 and L_2 are regular languages, is $L_1 \cup L_2$?

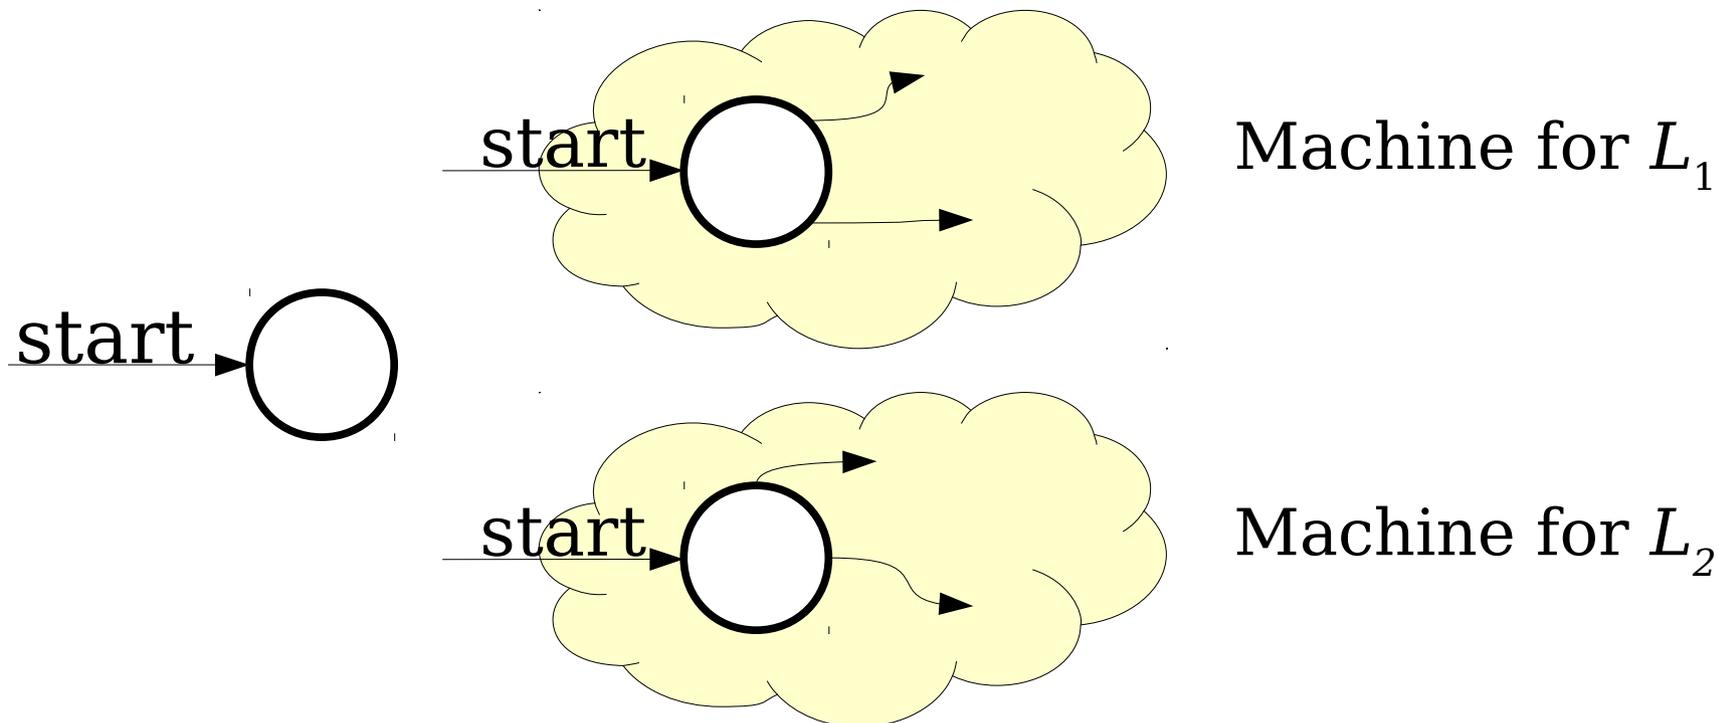

The Union of Two Languages

- If L_1 and L_2 are languages over the alphabet Σ , the language $L_1 \cup L_2$ is the language of all strings in at least one of the two languages.
- If L_1 and L_2 are regular languages, is $L_1 \cup L_2$?

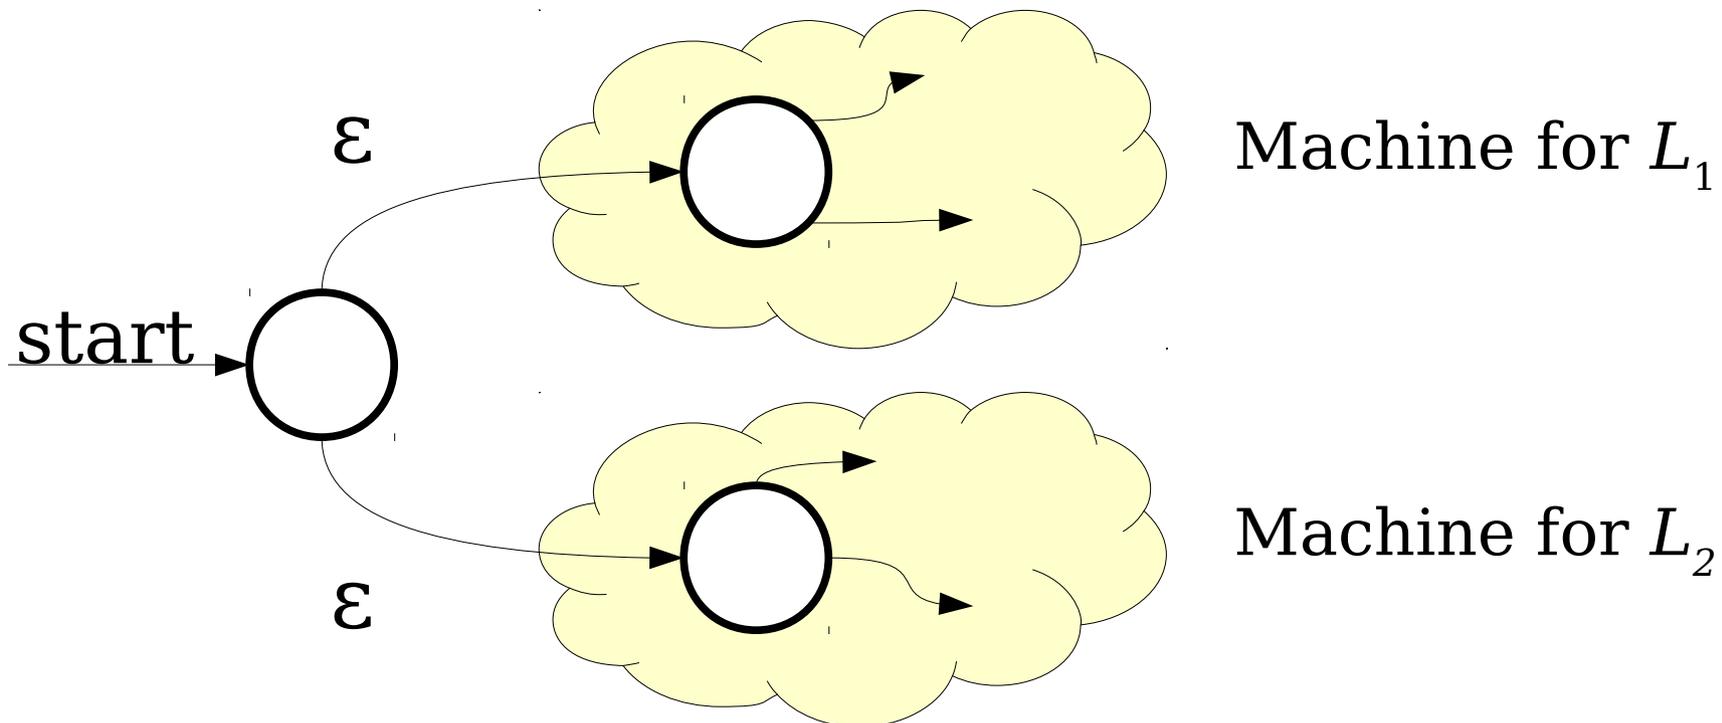

The Union of Two Languages

- If L_1 and L_2 are languages over the alphabet Σ , the language $L_1 \cup L_2$ is the language of all strings in at least one of the two languages.
- If L_1 and L_2 are regular languages, is $L_1 \cup L_2$?

The Union of Two Languages

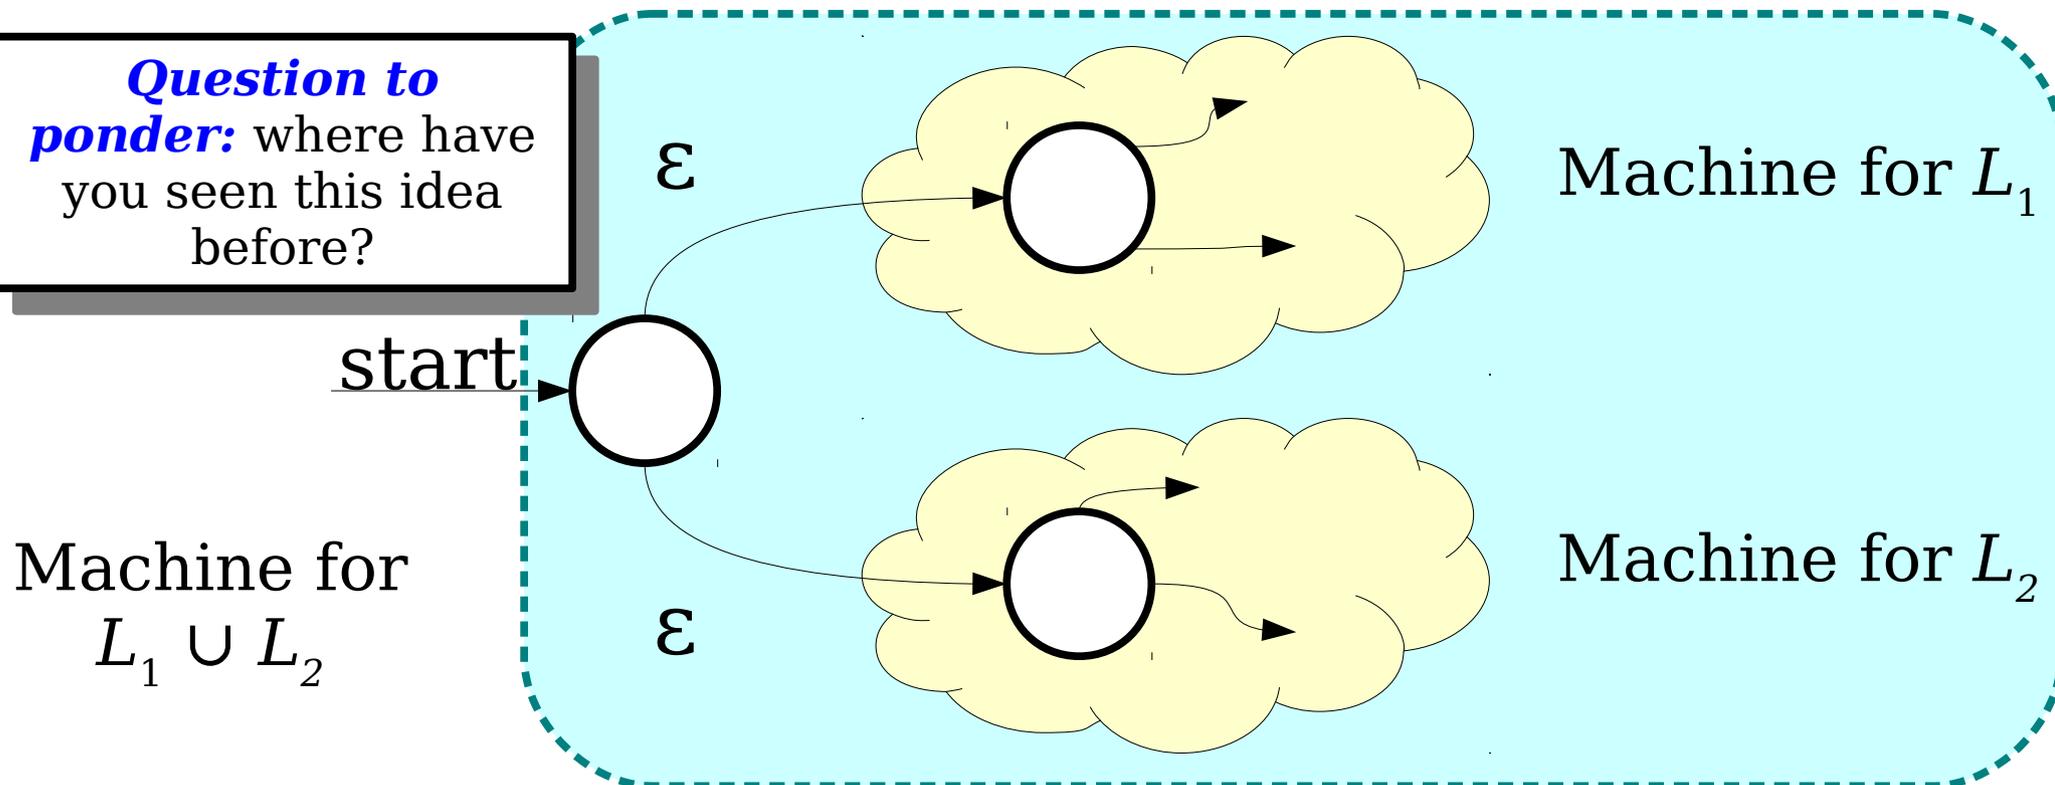

- If L_1 and L_2 are languages over the alphabet Σ , the language $L_1 \cup L_2$ is the language of all strings in at least one of the two languages.
- If L_1 and L_2 are regular languages, is $L_1 \cup L_2$?

The Union of Two Languages

- If L_1 and L_2 are languages over the alphabet Σ , the language $L_1 \cup L_2$ is the language of all strings in at least one of the two languages.
- If L_1 and L_2 are regular languages, is $L_1 \cup L_2$?

Question to ponder: where have you seen this idea before?

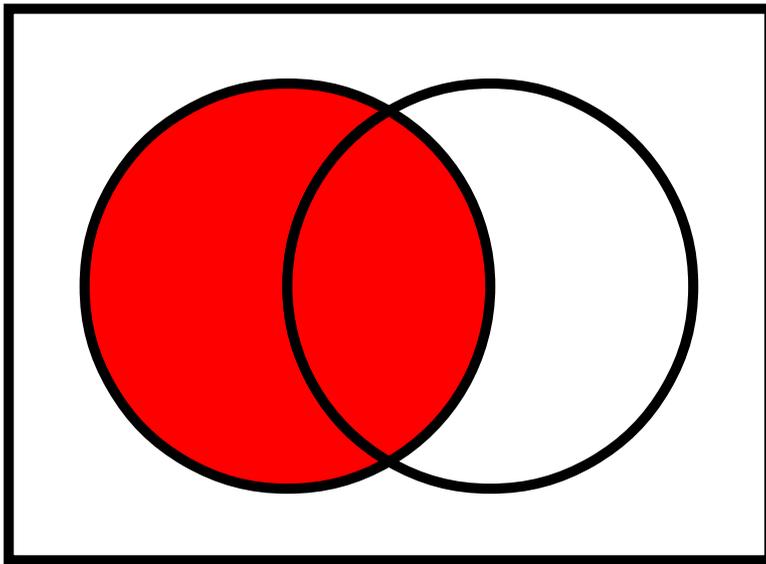

The Intersection of Two Languages

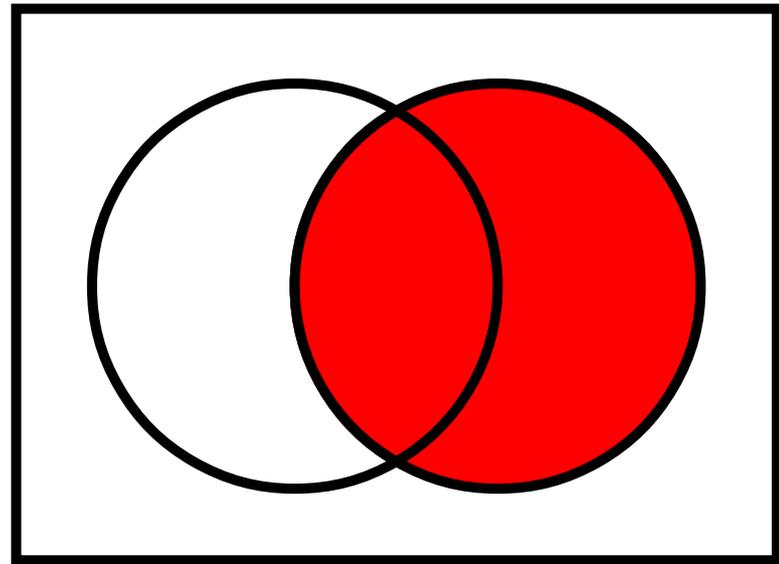

- If L_1 and L_2 are languages over Σ , then $L_1 \cap L_2$ is the language of strings in both L_1 and L_2 .
- Question: If L_1 and L_2 are regular, is $L_1 \cap L_2$ regular as well?

The Intersection of Two Languages

- If L_1 and L_2 are languages over Σ , then $L_1 \cap L_2$ is the language of strings in both L_1 and L_2 .
- Question: If L_1 and L_2 are regular, is $L_1 \cap L_2$ regular as well?

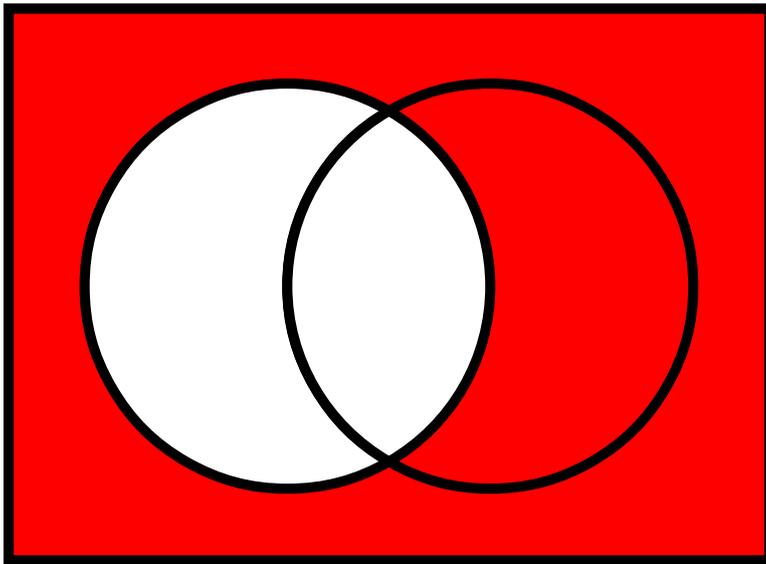

L_1

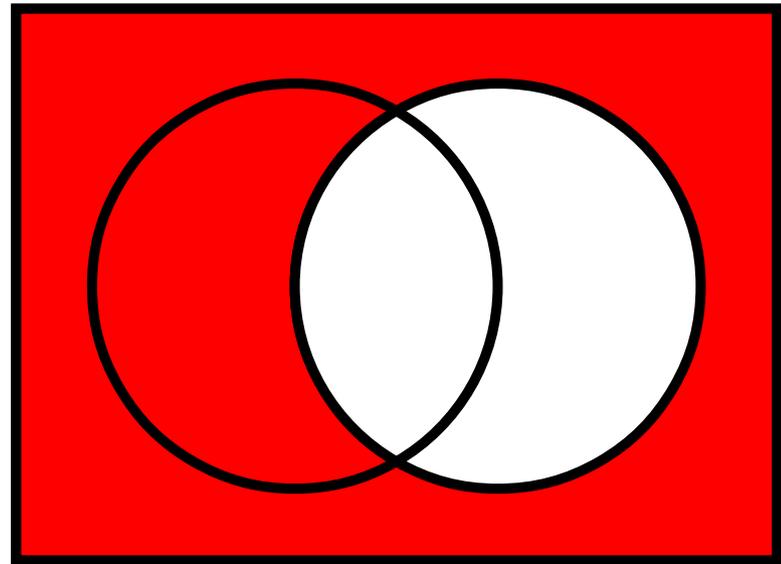

L_2

The Intersection of Two Languages

- If L_1 and L_2 are languages over Σ , then $L_1 \cap L_2$ is the language of strings in both L_1 and L_2 .
- Question: If L_1 and L_2 are regular, is $L_1 \cap L_2$ regular as well?

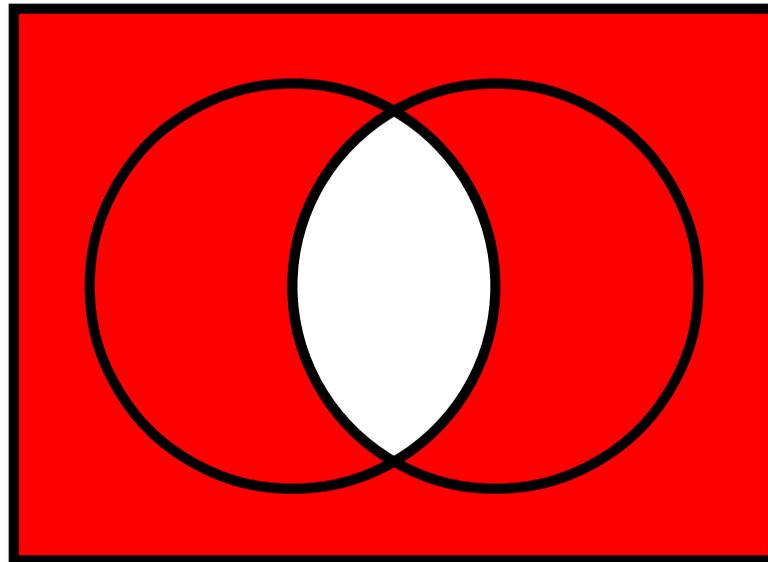

\bar{L}_1

\bar{L}_2

The Intersection of Two Languages

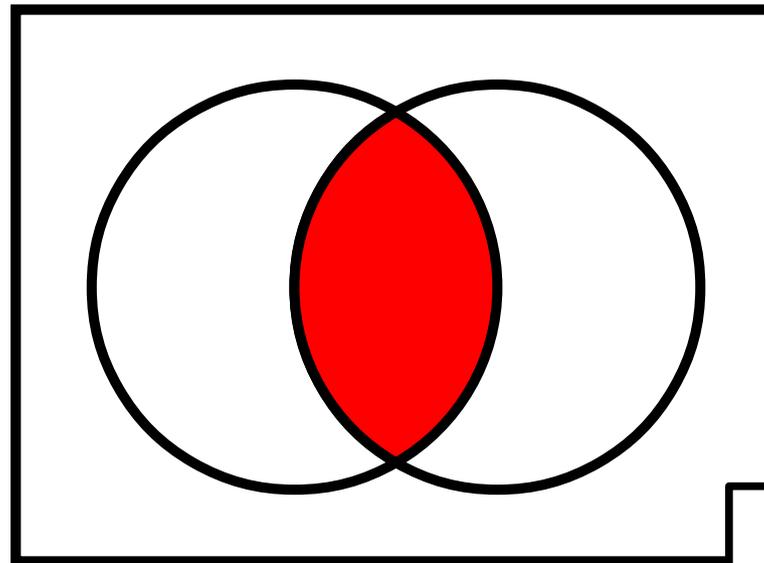

- If L_1 and L_2 are languages over Σ , then $L_1 \cap L_2$ is the language of strings in both L_1 and L_2 .
- Question: If L_1 and L_2 are regular, is $L_1 \cap L_2$ regular as well?

$$\bar{L}_1 \cup \bar{L}_2$$

The Intersection of Two Languages

- If L_1 and L_2 are languages over Σ , then $L_1 \cap L_2$ is the language of strings in both L_1 and L_2 .
- Question: If L_1 and L_2 are regular, is $L_1 \cap L_2$ regular as well?

$$\overline{L_1} \cup \overline{L_2}$$

Hey, it's De Morgan's laws!

Concatenation

String Concatenation

- If $w \in \Sigma^*$ and $x \in \Sigma^*$, the **concatenation** of w and x , denoted wx , is the string formed by tacking all the characters of x onto the end of w .
- Example: if $w = \text{quo}$ and $x = \text{kka}$, the concatenation $wx = \text{quokka}$.
- This is analogous to the $+$ operator for strings in many programming languages.
- Some facts about concatenation:
 - The empty string ε is the **identity element** for concatenation:

$$w\varepsilon = \varepsilon w = w$$

- Concatenation is **associative**:

$$wxy = w(xy) = (wx)y$$

Concatenation

- The **concatenation** of two languages L_1 and L_2 over the alphabet Σ is the language

$$L_1L_2 = \{ wx \in \Sigma^* \mid w \in L_1 \wedge x \in L_2 \}$$

Concatenation Example

- Let $\Sigma = \{ a, b, \dots, z, A, B, \dots, Z \}$ and consider these languages over Σ :
 - ***Noun*** = { **Puppy, Rainbow, Whale, ...** }
 - ***Verb*** = { **Hugs, Juggles, Loves, ...** }
 - ***The*** = { **The** }
- The language ***TheNounVerbTheNoun*** is
 - { **ThePuppyHugsTheWhale,**
TheWhaleLovesTheRainbow,
TheRainbowJugglesTheRainbow, ... }

Concatenation

- The **concatenation** of two languages L_1 and L_2 over the alphabet Σ is the language

$$L_1L_2 = \{ wx \in \Sigma^* \mid w \in L_1 \wedge x \in L_2 \}$$

- Two views of L_1L_2 :
 - The set of all strings that can be made by concatenating a string in L_1 with a string in L_2 .
 - The set of strings that can be split into two pieces: a piece from L_1 and a piece from L_2 .

This is closely related to, but different than, the Cartesian product.

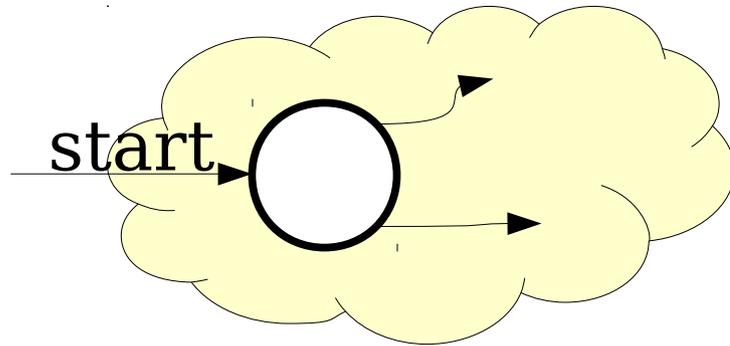

Question to ponder: In what ways are concatenations similar to Cartesian products? In what ways are they different?

Concatenating Regular Languages

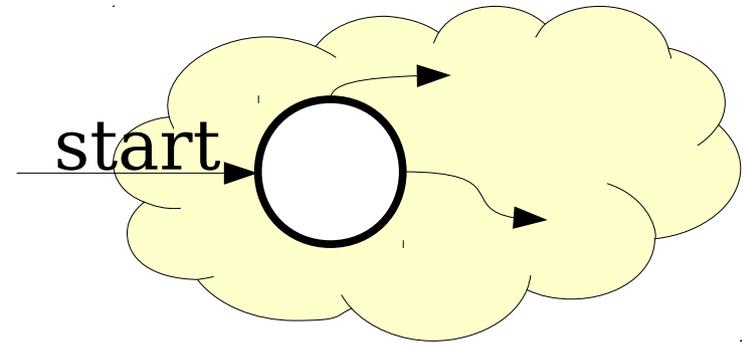

- If L_1 and L_2 are regular languages, is L_1L_2 ?
- Intuition - can we split a string w into two strings xy such that $x \in L_1$ and $y \in L_2$?

Concatenating Regular Languages

- If L_1 and L_2 are regular languages, is L_1L_2 ?
- Intuition - can we split a string w into two strings xy such that $x \in L_1$ and $y \in L_2$?

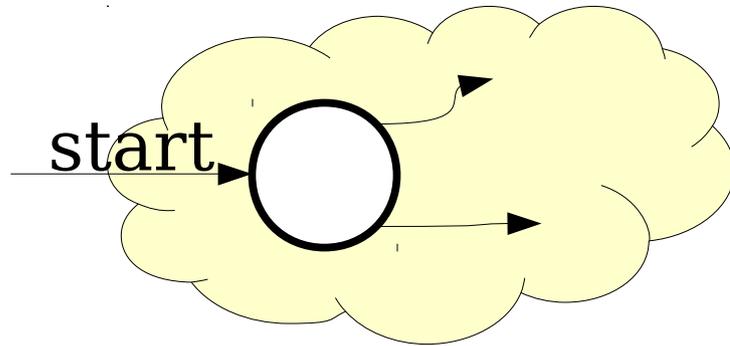

Machine for L_1

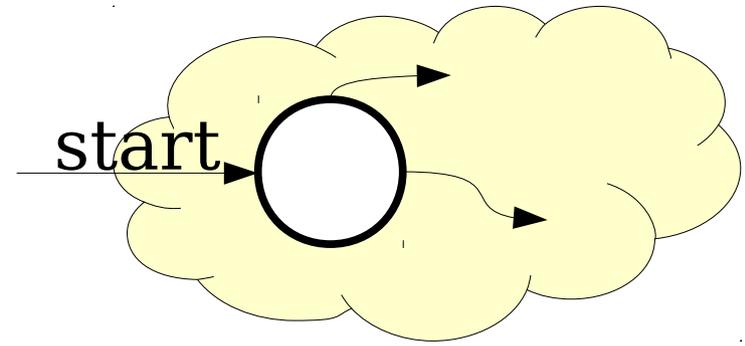

Machine for L_2

Concatenating Regular Languages

Concatenating Regular Languages

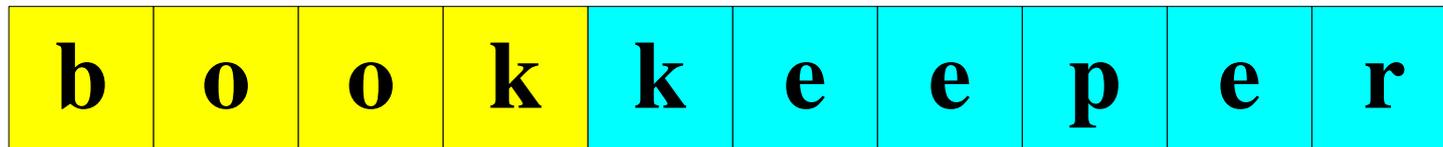

- If L_1 and L_2 are regular languages, is L_1L_2 ?
- Intuition - can we split a string w into two strings xy such that $x \in L_1$ and $y \in L_2$?

Machine for L_1

Concatenating Regular Languages

- If L_1 and L_2 are regular languages, is L_1L_2 ?
- Intuition - can we split a string w into two strings xy such that $x \in L_1$ and $y \in L_2$?
- **Idea:**
 - Run a DFA/NFA for L_1 on w .
 - Whenever it reaches an accepting state, optionally hand the rest of w to a DFA/NFA for L_2 .
 - If the automaton for L_2 accepts the rest, $w \in L_1L_2$.
 - If the automaton for L_2 rejects the remainder, the split was incorrect.

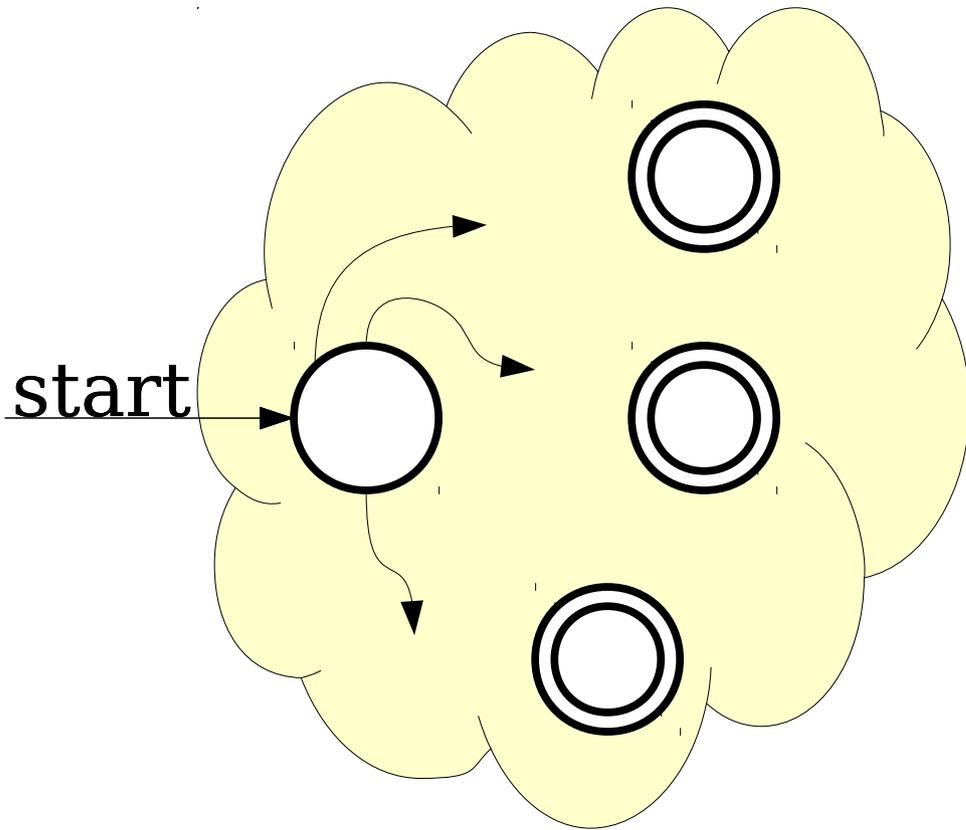

Concatenating Regular Languages

Lots and Lots of Concatenation

- Consider the language $L = \{ \mathbf{aa}, \mathbf{b} \}$
- LL is the set of strings formed by concatenating pairs of strings in L .

$\{ \mathbf{aaaa}, \mathbf{aab}, \mathbf{baa}, \mathbf{bb} \}$

- LLL is the set of strings formed by concatenating triples of strings in L .

$\{ \mathbf{aaaaaa}, \mathbf{aaaab}, \mathbf{aabaa}, \mathbf{aabb}, \mathbf{baaaa}, \mathbf{baab}, \mathbf{bbaa}, \mathbf{bbb} \}$

- $LLLL$ is the set of strings formed by concatenating quadruples of strings in L .

$\{ \mathbf{aaaaaaaa}, \mathbf{aaaaaab}, \mathbf{aaaabaa}, \mathbf{aaaabb}, \mathbf{aabaaaa}, \mathbf{aabaab}, \mathbf{aabbaa}, \mathbf{aabbb}, \mathbf{baaaaaa}, \mathbf{baaaab}, \mathbf{baabaa}, \mathbf{baabb}, \mathbf{bbaaaa}, \mathbf{bbaab}, \mathbf{bbbaa}, \mathbf{bbbb} \}$

Language Exponentiation

- We can define what it means to “exponentiate” a language as follows:
- $L^0 = \{\varepsilon\}$
 - Intuition: The only string you can form by gluing no strings together is the empty string.
 - Notice that $\{\varepsilon\} \neq \emptyset$. Can you explain why?
- $L^{n+1} = LL^n$
 - Idea: Concatenating $(n+1)$ strings together works by concatenating n strings, then concatenating one more.
- **Question to ponder:** Why define $L^0 = \{\varepsilon\}$?
- **Question to ponder:** What is \emptyset^0 ?

The Kleene Star

The Kleene Closure

- An important operation on languages is the ***Kleene Closure***, which is defined as

$$L^* = \{ w \in \Sigma^* \mid \exists n \in \mathbb{N}. w \in L^n \}$$

- Mathematically:

$$w \in L^* \quad \leftrightarrow \quad \exists n \in \mathbb{N}. w \in L^n$$

- Intuitively, L^* is the language all possible ways of concatenating zero or more strings in L together, possibly with repetition.
- ***Question to ponder:*** What is \emptyset^* ?

The Kleene Closure

If $L = \{ \mathbf{a}, \mathbf{bb} \}$, then $L^* = \{$

$\epsilon,$

$\mathbf{a}, \mathbf{bb},$

$\mathbf{aa}, \mathbf{abb}, \mathbf{bba}, \mathbf{bbbb},$

$\mathbf{aaa}, \mathbf{aabb}, \mathbf{abba}, \mathbf{abbbb}, \mathbf{bbaa}, \mathbf{bbabb}, \mathbf{bbbba}, \mathbf{bbbbbb},$

\dots

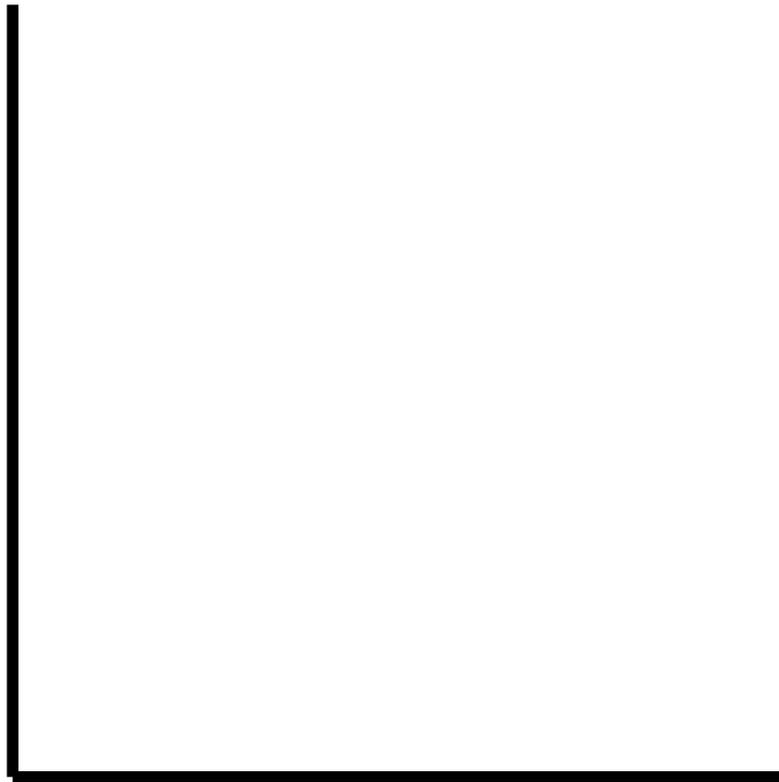

$\}$

Think of L^* as the set of strings you can make if you have a collection of stamps – one for each string in L – and you form every possible string that can be made from those stamps.

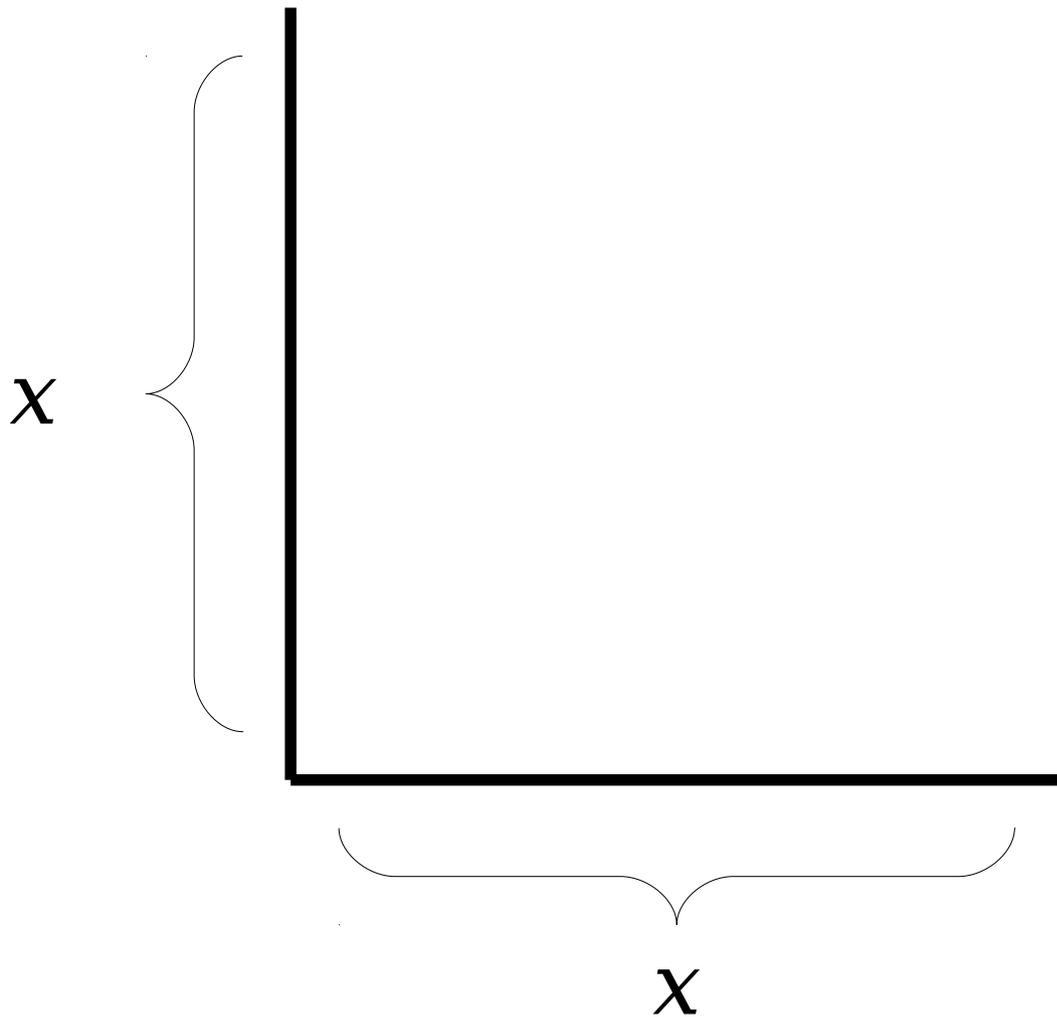

Reasoning about Infinity

- If L is regular, is L^* necessarily regular?
-  **A Bad Line of Reasoning:** 
 - $L^0 = \{ \varepsilon \}$ is regular.
 - $L^1 = L$ is regular.
 - $L^2 = LL$ is regular
 - $L^3 = L(LL)$ is regular
 - ...
 - Regular languages are closed under union.
 - So the union of all these languages is regular.

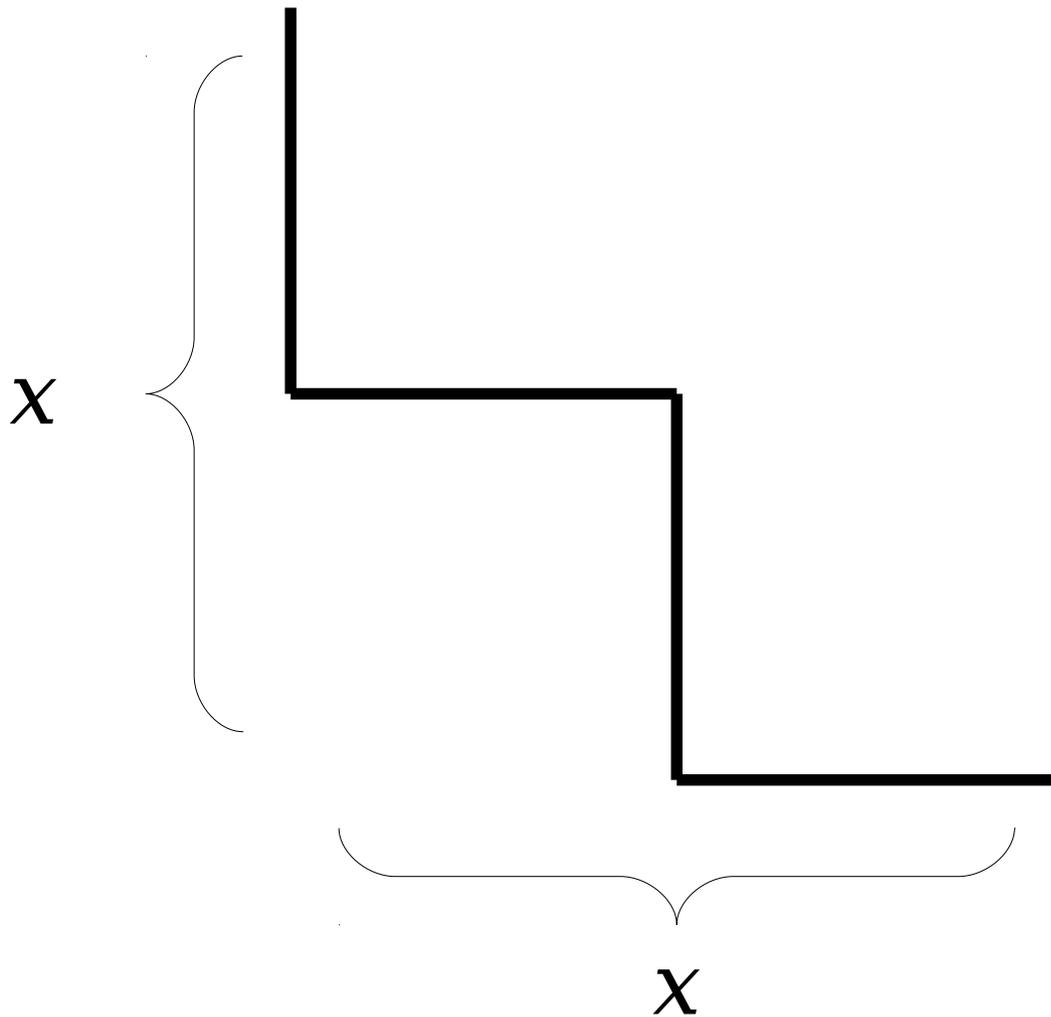

Reasoning about Infinity

∞ is finite
^ not

Reasoning About the Infinite

- If a series of finite objects all have some property, the “limit” of that process *does not* necessarily have that property.
- In general, it is not safe to conclude that some property that always holds in the finite case must hold in the infinite case.
 - (This is why calculus is interesting).
- So our earlier argument ($L^* = L^0 \cup L^1 \cup \dots$) isn't going to work.
- We need a different line of reasoning.

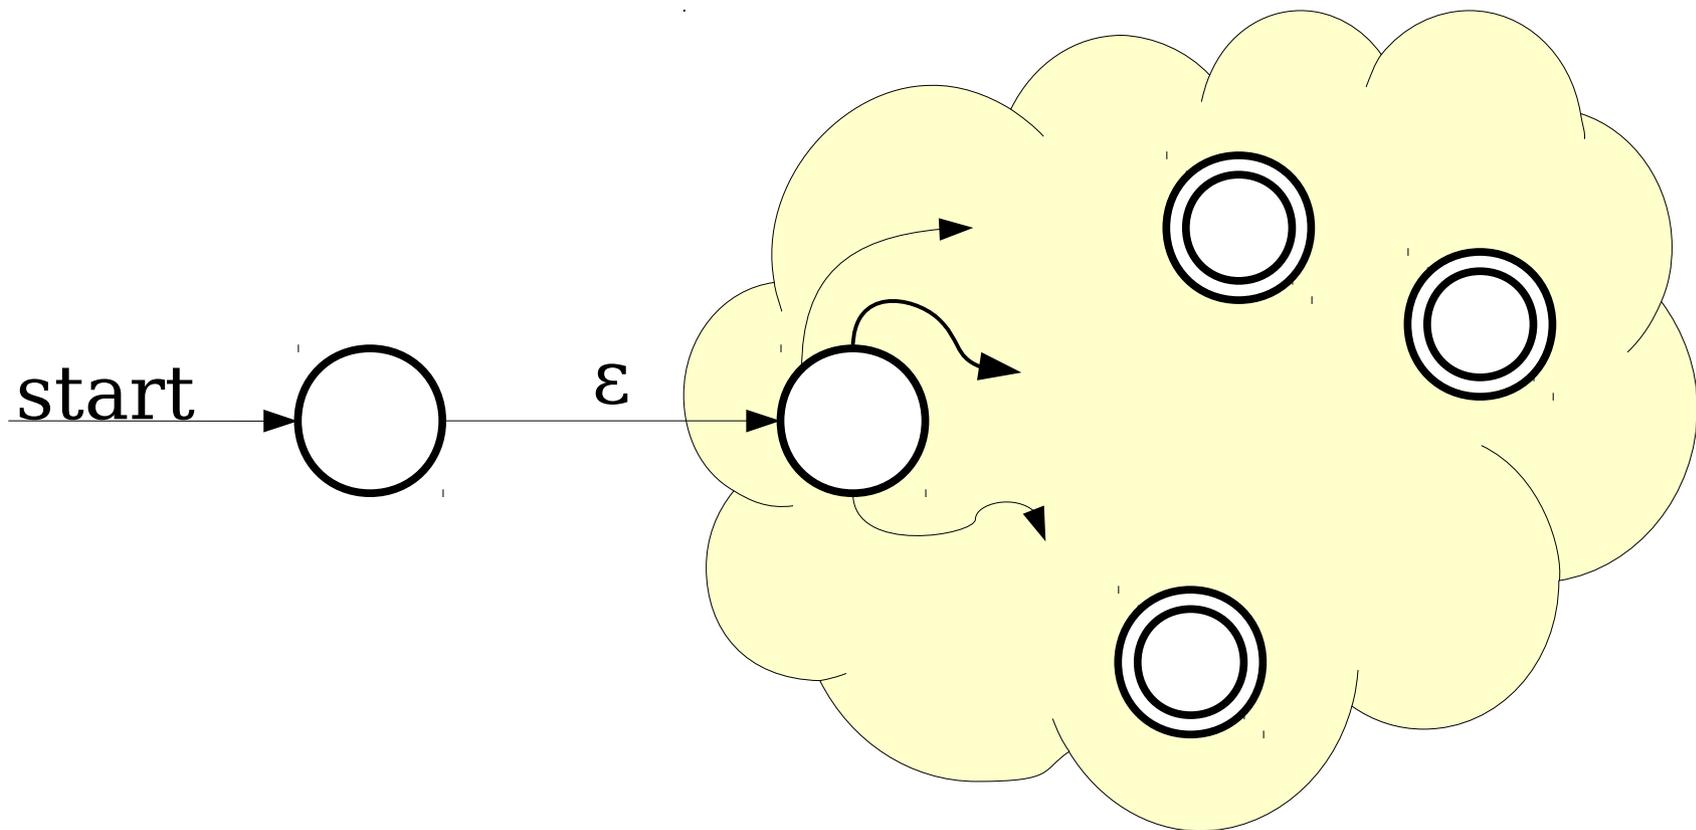

Idea: Can we directly convert an NFA for language L to an NFA for language L^* ?

Question: Why add the new state out front? Why not just make the old start state accepting?

Closure Properties

- ***Theorem:*** If L_1 and L_2 are regular languages over an alphabet Σ , then so are the following languages:
 - \bar{L}_1
 - $L_1 \cup L_2$
 - $L_1 \cap L_2$
 - L_1L_2
 - L_1^*
- These properties are called ***closure properties of the regular languages.***
