

The Big Picture

Announcements

- Problem Set 9 was due thirty minutes ago. Solutions are available on the course website.

***Congratulations - you're done
with CS103 problem sets!***

- Score distribution for PS8:

A Fun Historical Note

- The results you've seen presented in CS103 were not discovered in the order you may have expected.
- For example:
 - Regular languages were developed after Turing machines.
 - Cantor had worked out different orders of infinity before the \cup and \cap symbols were invented.
- Check out the “Timeline of CS103 Results” on the course website for more information!

Please evaluate this course on Axess.
Your feedback really makes a difference.

Final Exam Logistics

- The final exam is now available online. It's due Thursday, December 9th, at 3:30PM.
- ***Best of luck on the exam - you've got this!***

Outline for Today

- ***The Big Picture***
 - Where have we been? Why did it all matter?
- ***Where to Go from Here***
 - What's next in CS theory?
- ***Your Questions***
 - What do you want to know?
- ***Final Thoughts!***

The Big Picture

Take a minute to reflect on your journey.

You've done more than just check
a bunch of boxes off a list.

You've given yourself the foundation
to tackle problems from all over
computer science.

PRPs and PRFs

From CS255

- Pseudo Random Function (**PRF**) defined over (K, X, Y) :

$$F: K \times X \rightarrow Y$$

such that exists “efficient” algorithm to evaluate $F(k, x)$

- Pseudo Random Permutation (**PRP**)

$$E: K \times X \rightarrow X$$

Functions defined
over Cartesian
products!

such that:

- Exists “efficient” algorithm to evaluate $E(k, x)$

Definitions in
terms of
efficiency!

Function $E(k, \cdot)$ is one-to-one

“efficient” inversion algorithm $D(k, y)$

Injectivity!

Semantics of JOINS (2 tables)

Cartesian
products!

```
SELECT R.A  
FROM R, S  
WHERE R.A = S.B
```

1. Take **cross product**:

$$X = R \times S$$

Recall: Cross product ($A \times B$) is the set of all unique tuples in A, B

Ex: $\{a, b, c\} \times \{1, 2\}$

$= \{(a, 1), (a, 2), (b, 1), (b, 2), (c, 1), (c, 2)\}$

2. Apply **selections / conditions**:

$$Y = \{(r, s) \in X \mid r.A = s.B\}$$

= Filtering!

set-builder
notation!

3. Apply **projections** to get final output:

$$Z = (y.A,) \text{ for } y \in Y$$

= Returning only *some*
attributes

Remembering this order is critical to understanding the output of certain queries
(see later on...)

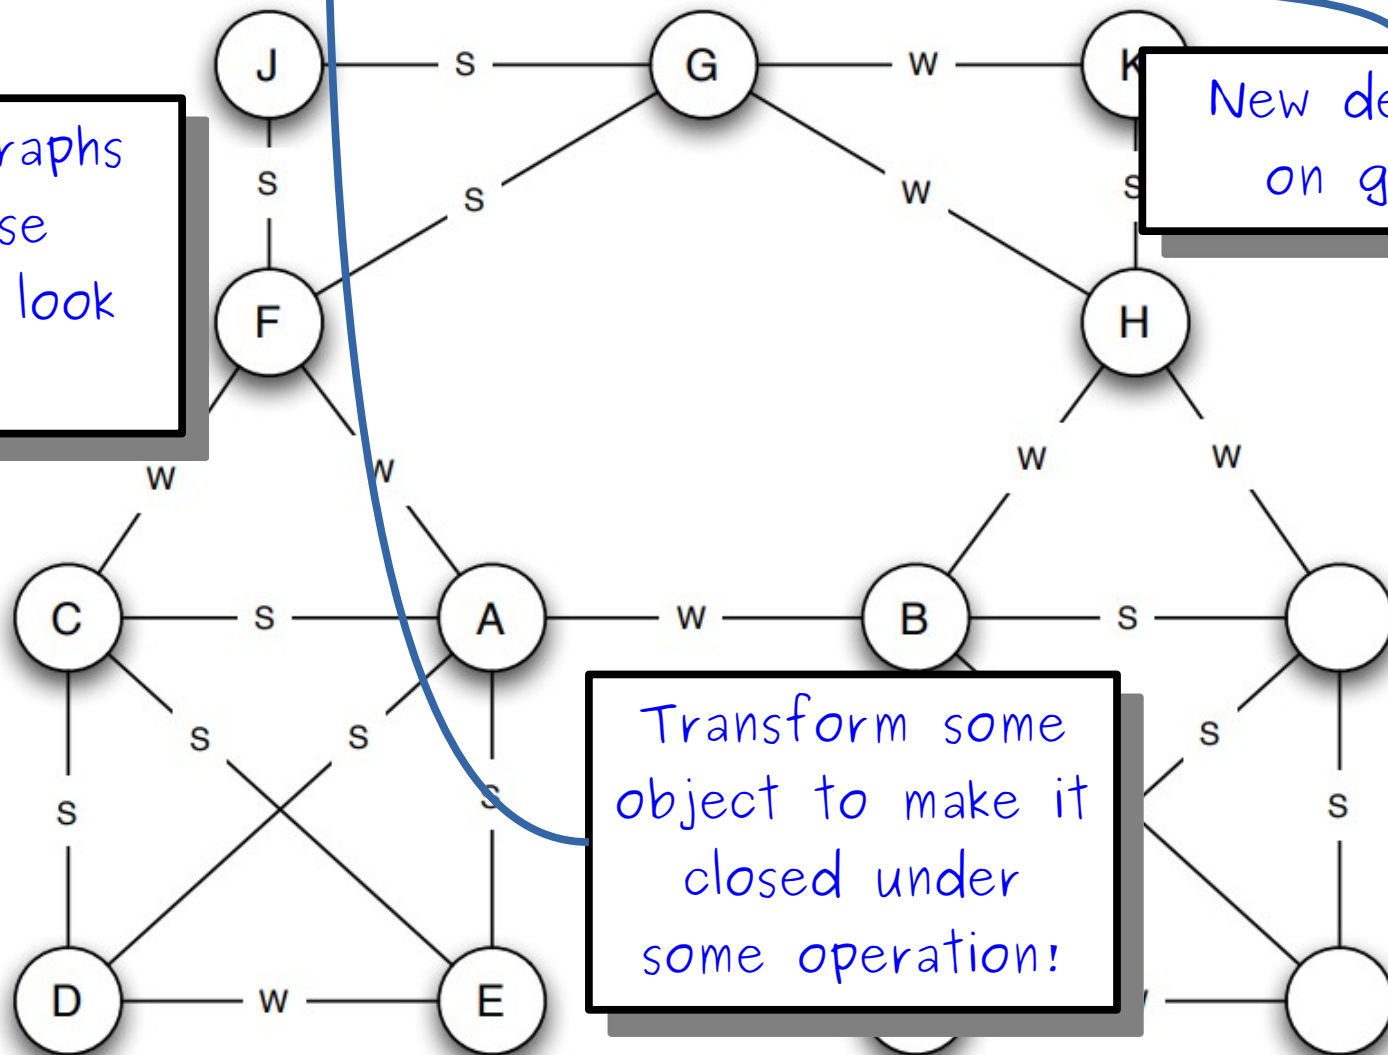

Strong triadic closure

If a node Q has two strong ties to nodes Y and Z, there is an edge between Y and Z

What do graphs with these properties look like?

New definitions on graphs!

Transform some object to make it closed under some operation!

Tokenization in NLTK

Bird, Loper and Klein (2009), *Natural Language Processing with Python*. O'Reilly

```
>>> text = 'That U.S.A. poster-print costs $12.40...'
>>> pattern = r'''(?x)      # set flag to allow verbose regexps
...     ([A-Z]\.)+          # abbreviations, e.g. U.S.A.
...     | \w+(-\w+)*         # words with optional internal hyphens
...     | \$?\d+(\.\d+)?%?   # currency and percentages, e.g. $12.40, 82%
...     | \.\.\.            # ellipsis
...     | [][.,;"'()?::-_'] # these are separate tokens; includes ], [
...     ,,,
>>> nltk.regexp_tokenize(text, pattern)
['That', 'U.S.A.', 'poster-print', 'costs', '$12.40', '...']
```

It's a big
regex!

Describing the
world in set
theory!

From CS237A

Planning in C-space

- Let $R(q) \subset W$ denote set of points in the world occupied by robot when in configuration q
- Robot in collision $\Leftrightarrow R(q) \cap O \neq \emptyset$
- Accordingly, *free space* is defined as: $C_{free} = \{q \in C \mid R(q) \cap O = \emptyset\}$
- Path planning problem in C-space: compute a **continuous** path: $\tau: [0,1] \rightarrow C_{free}$, with $\tau(0) = q_I$ and $\tau(1) = q_G$

Model paths
as functions!

CS251: Cryptocurrencies and Blockchain Technologies

Fall 2018

Assignment #1

Due: 11:59pm on Mon., **Oct. 8, 2018**

Submit via Gradescope (each answer on a separate page) code: **9RZGVZ**

Problem 1. Hash functions and proofs of work. In class we defined two security properties for a hash function, one called collision resistance and the other called proof-of-work security. Show that a collision-resistant hash function may not be proof-of-work secure.

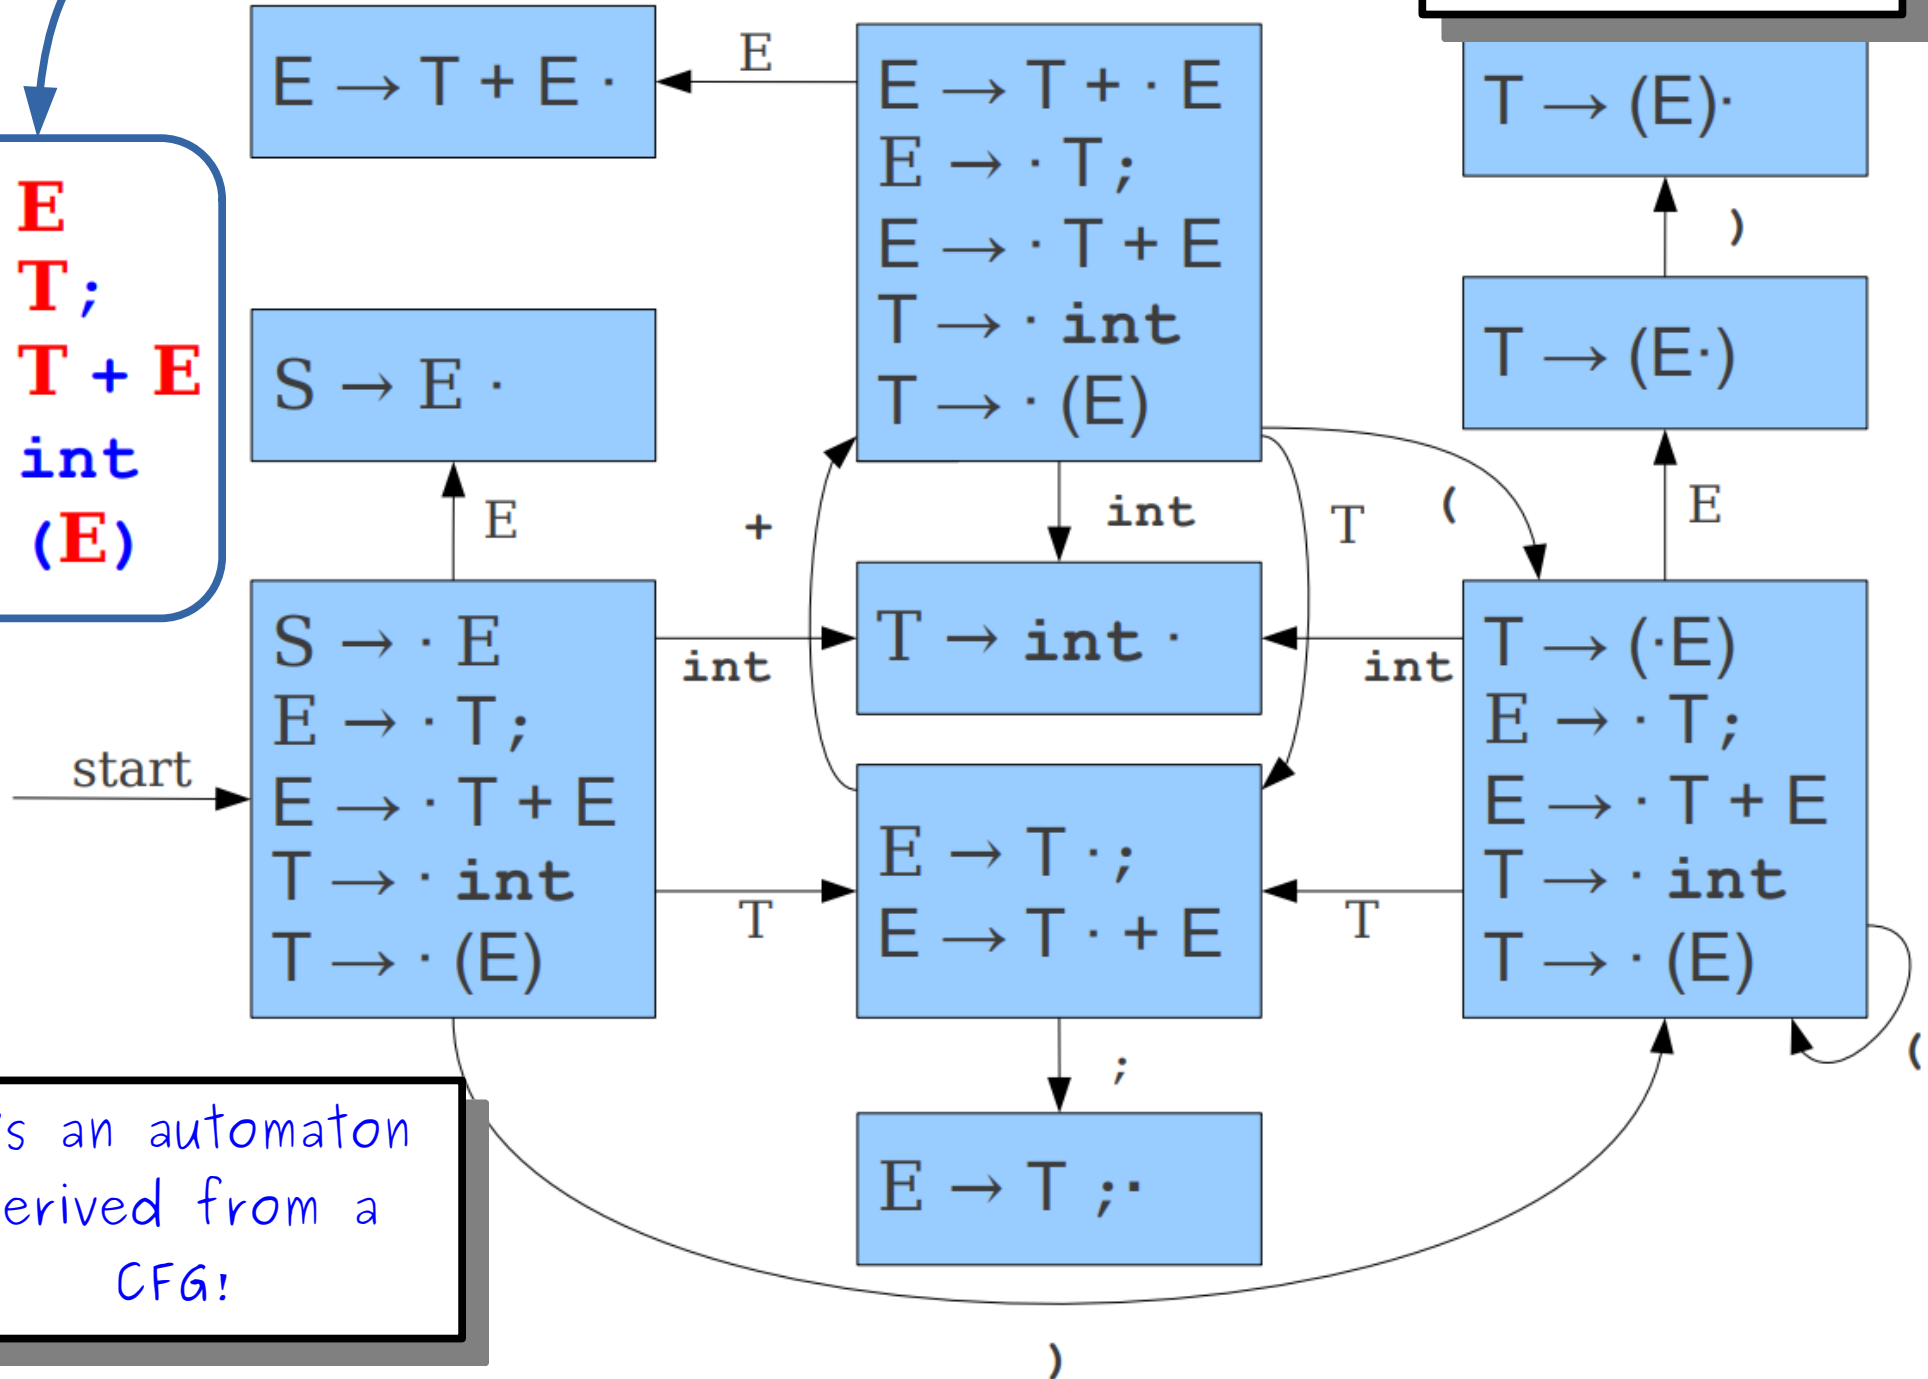

Hint: let $H : X \times Y \rightarrow \{0, 1, \dots, 2^n - 1\}$ be a collision-resistant hash function. Construct a new hash function $H' : X \times Y \rightarrow \{0, 1, \dots, 2^m - 1\}$ (where m may be greater than n) that is also collision resistant, but for a fixed difficulty D (say, $D = 2^{32}$) is not proof-of-work secure with difficulty D . That is, for every puzzle $x \in X$ it should be trivial to find a solution $y \in Y$ such that $H'(x, y) < 2^m/D$. This is despite H' being collision resistant. Remember to explain why your H' is collision resistant, that is, explain why a collision on H' would yield a collision on H .

Whoa, it's a
function!

It's a CFG!

From CS143

S → **E**
E → **T**;
E → **T** + **E**
T → **int**
T → (**E**)

It's an automaton
derived from a
CFG!

Search problems

From CS221

Definition: search problem

States: the set of states

$s_{\text{start}} \in \text{States}$: starting state

$\text{Actions}(s)$: possible actions from state s

$\text{Succ}(s, a)$: where we end up if take action a in state s

$\text{Cost}(s, a)$: cost for taking action a in state s

$\text{IsEnd}(s)$: whether at end

- $\text{Succ}(s, a) \Rightarrow T(s, a, s')$
- $\text{Cost}(s, a) \Rightarrow \text{Reward}(s, a, s')$

It's a
DFA!

II. Transfer Functions

- A family of transfer functions F
- Basic Properties $f: V \rightarrow V$
 - Has an identity function
 - $\exists f$ such that $f(x) = x$, for all x .
 - Closed under composition
 - if $f_1, f_2 \in F$, $f_1 \bullet f_2 \in F$

It's functions
with specific
properties!

pronounced “big-oh of ...” or sometimes “oh of ...”

From CS161

$O(\dots)$ means an upper bound

- Let $T(n)$, $g(n)$ be functions of positive integers.
 - Think of $T(n)$ as being a runtime: positive and increasing in n .
- We say “ $T(n)$ is $O(g(n))$ ” if $g(n)$ grows at least as fast as $T(n)$ as n gets large.
- Formally,

$$\begin{aligned} T(n) = O(g(n)) \\ \iff \\ \exists c, n_0 > 0 \text{ s.t. } \forall n \geq n_0, \\ 0 \leq T(n) \leq c \cdot g(n) \end{aligned}$$

It's FOL and functions!

- Graph $G(V, E)$ has **expansion α** : if $\forall S \subseteq V$:
of edges leaving $S \geq \alpha \cdot \min(|S|, |V \setminus S|)$
- Or equivalently:

$$\alpha = \min_{S \subseteq V} \frac{\text{\# edges leaving } S}{\min(|S|, |V \setminus S|)}$$

Set difference
and cardinality!

First-order
definitions on
graphs!

Typed lambda calculus

To understand the formal concept of a type system, we're going to extend our lambda calculus from last week (henceforth the “untyped” lambda calculus) with a notion of types (the “simply typed” lambda calculus). Here's the essentials of the language:

Type $\tau ::=$	int	integer
	$\tau_1 \rightarrow \tau_2$	function
Expression $e ::=$	x	variable
	n	integer
	$e_1 \oplus e_2$	binary operation
	$\lambda (x : \tau) . e$	function
	$e_1 e_2$	application
Binop $\oplus ::=$	+ - * /	

It's a
CFG!

First, we introduce a language of types, indicated by the variable tau (τ). A type is either an integer, or a function from an input type τ_1 to an output type τ_2 . Then we extend our untyped lambda calculus with the same arithmetic language from the first lecture (numbers and binary operators)⁴. Usage of the language looks similar to before:

Definitions
in terms of
strings!

From CS166

The Anatomy of a Suffix Tree

- A **branching word** in $T\$$ is a string ω such that there are characters $a \neq b$ where ωa and ωb are substrings of $T\$$.

- Edge case: the empty string is always considered branching.

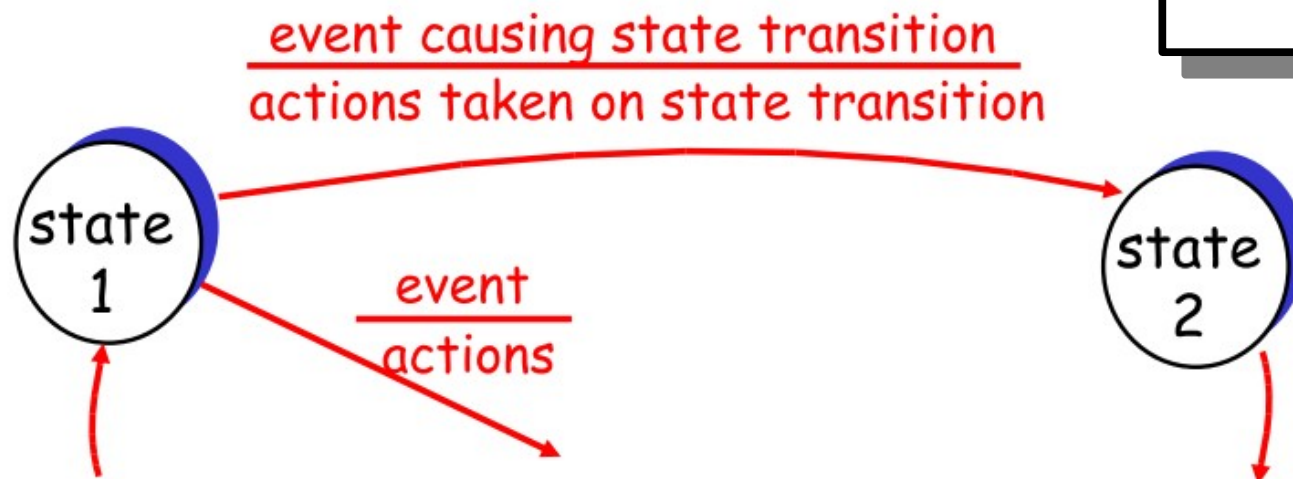

- **Theorem:** The suffix tree for a string T has an internal node for a string ω if and only if ω is a branching word in $T\$$.

nonsense\$
012345678

Finite State Machines

From CS144

- **Represent protocols using state machines**

- Sender and receiver each have a state
- Start in some initial state
- Events cause each side to select a state transition

*It's a generalization
of DFAs!*

- **Transition specifies action taken**

- Specified as events/actions
- E.g., software calls send/put packet on network
- E.g., packet arrives/send acknowledgment

Reducibility!

By definition, we need to output y if and only if $y \in S$. That is, *answering membership queries reduces to solving the Heavy Hitters problem*. By the “membership problem,” we mean the task of preprocessing a set S to answer queries of the form “is $y \in S$ ”? (A hash table is the most common solution to this problem.) It is intuitive that you cannot correctly answer all membership queries for a set S without storing S (thereby using linear, rather than constant, space) — if you throw some of S out, you might get a query asking about the part you threw out, and you won’t know the answer. It’s not too hard to make this idea precise using the Pigeonhole Principle.⁵

A Myhill-
Nerode-style
argument!

Kolmogorov Complexity (1960's)

Definition: The *shortest description* of x , denoted as $d(x)$, is the lexicographically shortest string $\langle M, w \rangle$ such that $M(w)$ halts with only x on its tape.

Definition: The *Kolmogorov complexity* of x , denoted as $K(x)$, is $|d(x)|$.

Using Turing machines to define intrinsic information content!

- Suppose we are given a set of documents D
 - Each document d covers a set X_d of words/topics/named entities W
- For a set of documents $A \subseteq D$ we define

$$F(A) = \left| \bigcup_{d \in A} X_d \right|$$

Functions, set union, and set cardinality!

- Goal: We want to

$$\max_{|A| \leq k} F(A)$$

- Note: $F(A)$ is a set function: $F(A): \text{Sets} \rightarrow \mathbb{N}$

You've given yourself the foundation
to tackle problems from all over
computer science.

There's so much more to explore.
Where should you go next?

Your Questions

What do you want to know?

Final Thoughts

A Huge Round of Thanks!

***There are more problems to
solve than there are programs
capable of solving them.***

There is so much more to explore and so many big questions to ask – ***many of which haven't been asked yet!***

You now know what problems we can solve,
what problems we can't solve, and what
problems we believe we can't solve
efficiently.

Our questions to you:

What problems will you ***choose*** to solve?
Why do those problems matter to you?
And how are you going to solve them?
