Solutions to Practice Midterm

Problem 1: Karel the Robot (20 points)

```java
/* File: InnerBorderKarel.java */

import stanford.karel.*;

public class InnerBorderKarel extends SuperKarel {

   public void run() {
      moveUpRow();
      for(int i = 0; i < 4; i++) {
         handleBorder();
         nextPosition();
      }
   }

   // Assumes Karel starts one avenue before the first beeper to
   // be placed in this line of the border.  Places beepers until
   // Karel reaches a wall, but does not place a beeper on the last
   // corner (where Karel is facing the wall).
   private void handleBorder() {
      move();
      while (frontIsClear()) {
         // We check for any existing beepers, so we don't put
         // two beepers on any of the "corners" of the border
         if (noBeepersPresent()) {
            putBeeper();
         }
         move();
      }
   }

   // Moves Karel up one row while keeping the same orientation
   private void moveUpRow() {
      turnLeft();
      move();
      turnRight();
   }

   // Assumes Karel is facing a wall at the end of line of placed
   // beepers and repositions Karel to be facing in direction of next
   // line in the border of beepers that needs to be placed
   private void nextPosition() {
      turnRight();
      move();
      turnRight();
      move();
      turnRight();
   }
}
```

Problem 2: Simple Java expressions, statements, and methods (20 points)

(2a)

`5.0 / 4 - 4 / 5`	1.25
`7 < 9 - 5 && 3 % 0 == 3`	`false`
`"B" + 8 + 4`	`"B84"`

(2b) **Answer:**

```
The 1st number is: 78
The 2nd number is: 73
```

Problem 3: Simple Java programs (25 points)

```java
/*
 * File: SecondLargest.java
 * -----------------------
 * This program finds the largest and second largest number
 * in a list entered by the user.
 */

import acm.program.*;

public class SecondLargest extends ConsoleProgram {

/* Defines the sentinel used to signal the end of the input */
   private static final int SENTINEL = 0;

   public void run() {
      println("This program finds the two largest integers in a");
      println("list.  Enter values, one per line, using a "
               + SENTINEL + " to");
      println("signal the end of the list.");

      int largest = -1;
      int secondLargest = -1;
      while (true) {
         int input = readInt(" ? ");
         if (input == SENTINEL) break;
         if (input > largest) {
            secondLargest = largest;
            largest = input;
         } else if (input > secondLargest) {
            secondLargest = input;
         }
      }

      println("The largest value is " + largest);
      println("The second largest is " + secondLargest);
   }
}
```

Problem 4: Using the graphics and random number libraries (35 points)

```java
/*
 * File: SimpleFrogger.java
 * ------------------------
 * This program solves the Frogger problem from the practice midterm.
 */

import acm.graphics.*;
import acm.program.*;
import java.awt.*;
import java.awt.event.*;

/*
 * This program gets a frog to jump one square in the closest
 * direction to a mouse click.
 */
public class SimpleFrogger extends GraphicsProgram {

    public void run() {
        frog = new GImage("frog.gif");
        fx = (NCOLUMNS / 2 + 0.5) * SQUARE_SIZE;
        fy = (NROWS - 0.5) * SQUARE_SIZE;
        add(frog, fx - frog.getWidth() / 2,
                  fy - frog.getHeight() / 2);
        addMouseListeners();
    }

/* Responds to a mouse click */
    public void mouseClicked(MouseEvent e) {
        double mx = e.getX();
        double my = e.getY();
        if (Math.abs(mx - fx) > Math.abs(my - fy)) {
            if (mx > fx) {
                moveFrog(SQUARE_SIZE, 0);
            } else {
                moveFrog(-SQUARE_SIZE, 0);
            }
        } else {
            if (my > fy) {
                moveFrog(0, SQUARE_SIZE);
            } else {
                moveFrog(0, -SQUARE_SIZE);
            }
        }
    }

/* Moves the frog by dx/dy as long as it remains inside the world */
    private void moveFrog(double dx, double dy) {
        if (insideFroggerWorld(fx + dx, fy + dy)) {
            fx += dx;
            fy += dy;
            frog.move(dx, dy);
        }
    }
```

```
/* Returns true if the point (x, y) is inside the frog's world */
   private boolean insideFroggerWorld(double x, double y) {
       return (x >= 0 && x <= NCOLUMNS * SQUARE_SIZE &&
               y >= 0 && y <= NROWS * SQUARE_SIZE);
   }

/* Private constants */
   private static final int SQUARE_SIZE = 75;
   private static final int NROWS = 4;
   private static final int NCOLUMNS = 7;

/* Private instance variables */
   private GImage frog;    /* The image of the frog */
   private double fx;       /* The x-coordinate of the frog's center */
   private double fy;       /* The y-coordinate of the frog's center */

/* Sets the graphics window size */
   public static final int APPLICATION_WIDTH = NCOLUMNS * SQUARE_SIZE;
   public static final int APPLICATION_HEIGHT = NROWS * SQUARE_SIZE;

}
```

Problem 5: Strings and characters (20 points)

```
/*
 * Removes any doubled letters from a string.
 */
   private String removeDoubledLetters(String str) {
       String result = "";
       for (int i = 0; i < str.length(); i++) {
          char ch = str.charAt(i);
          if (i == 0 || ch != str.charAt(i - 1)) {
             result += ch;
          }
       }
       return result;
   }
```
