

## Section Handout #2—Simple Java

Portions of this handout by Eric Roberts

### 1. The Fibonacci sequence

In the 13th century, the Italian mathematician Leonardo Fibonacci—as a way to explain the geometric growth of a population of rabbits—devised a mathematical sequence that now bears his name. The first two terms in this sequence, `Fib(0)` and `Fib(1)`, are 0 and 1, and every subsequent term is the sum of the preceding two. Thus, the first several terms in the Fibonacci sequence look like this:

```
Fib(0) = 0
Fib(1) = 1
Fib(2) = 1 (0 + 1)
Fib(3) = 2 (1 + 1)
Fib(4) = 3 (1 + 2)
Fib(5) = 5 (2 + 3)
```

Write a program that displays the terms in the Fibonacci sequence, starting with `Fib(0)` and continuing as long as the terms are less than or equal to 10,000. Thus, your program should produce the following sample run:

```
Fibonacci
This program lists the Fibonacci sequence.
0
1
1
2
3
5
8
13
21
34
55
89
144
233
377
610
987
1597
2584
4181
6765
```

This program should continue as long as the value of the term is less than or equal to the maximum value. To do this, you should use a `while` loop, presumably with a header line that looks like this:

```
while (term <= MAX_TERM_VALUE)
```

Note that the maximum term value is specified using a named constant. Your program should work properly regardless of the value of `MAX_TERM_VALUE`.

## 2. Calculating lines

Write an interactive console program that calculates  $y$  coordinates on a line. First, it prompts the user for a slope,  $m$ , and an intercept term,  $b$  (remember that a line has an equation of the form  $y = mx + b$ ). Then, the program prompts the user for  $x$  values until the user enters the **SENTINEL** (the value of which is specified using a named constant). For each entered number, print the  $y$  value on that line for that entered  $x$  value. Here is a sample run of the program, with **SENTINEL** = **-1** (user input is underlined):

```
This program calculates y coordinates for a line.  
Enter slope (m): 2  
Enter intercept (b): 4  
Enter x: 5  
f(5) = 14  
Enter x: 1  
f(1) = 6  
Enter x: -1
```

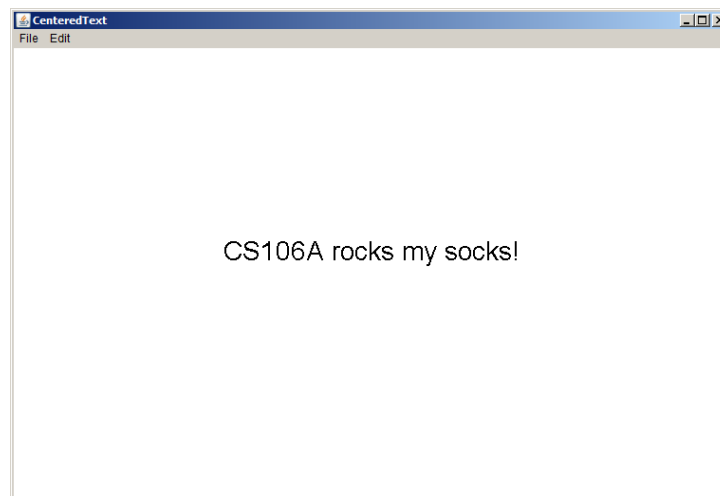

Your program should work properly regardless of the value of **SENTINEL**.

## 3. Drawing Centered Text

Your job is to write a `GraphicsProgram` that displays the text message (i.e., `GLabel`):

**CS106A rocks my socks!**

The text should be displayed in SansSerif 28-point font, and centered horizontally and vertically in the middle of the graphics window, looking something like this:

You can find the width of a label by calling `label.getWidth()` and the height it extends above the baseline by calling `label.getAscent()`. If you want to center a label, you need to shift its origin by half of these distances in each direction.

#### 4. Drawing a face

Your job is to draw a robot-looking face like the one shown in the following sample run:

This simple face consists of four parts—a head, two eyes, and a mouth—which are arranged as follows:

- *The head.* The head is a big rectangle whose dimensions are given by the named constants `HEAD_WIDTH` and `HEAD_HEIGHT`. The head is gray.
- *The eyes.* The eyes should be circles whose radius in pixels is given by the named constant `EYE_RADIUS`. The centers of the eyes should be set horizontally a quarter of the width of the head in from either edge, and one quarter of the distance down from the top of the head. The eyes are yellow.
- *The mouth.* The mouth should be centered with respect to the head in the  $x$ -dimension and one quarter of the distance up from the bottom of the head in the  $y$ -dimension. The dimensions of the mouth are given by the named constants `MOUTH_WIDTH` and `MOUTH_HEIGHT`. The mouth is white.

Finally, the robot face should be centered in the graphics window.
