

Images

CS106A, Stanford University

Housekeeping

- Handout: Image Reference Guide
 - We'll be talking through a lot of that today
- Katie Creel will give a guest mini-lecture on the ethics of image manipulation next class
 - There are questions about that on Assignment #3, so you definitely want to pay attention!

More on Lists

Lists as Parameters

- When you pass a list as a parameter you are passing a reference to the actual list
 - It's like getting a URL to the list (*pass-by-reference*)
 - In function, changes to values in list persist after function ends

```
def add_five(num_list):  
    for i in range(len(num_list)):  
        num_list[i] += 5  
  
def main():  
    values = [5, 6, 7, 8]  
    add_five(values)  
    print(values)
```

Output [10, 11, 12, 13]

When Passed as Parameters

Types that are "immutable"

int
float
bool
string

- When you assign new value to variable, you are assigning luggage tag (name) to a new value.
- For parameters, the original variable value you passed in is **not** changed when function is done.

Types that are "mutable"

list

(we'll see more soon)

- When you are changing the variable *in place*, the luggage tag does not change, but the value inside the luggage does.
- For parameters, it means original variable value you passed in **is** changed when function is done.

More on Lists as Parameters

- But, watch out if you create a new list in a function
 - Creating a new list means you're no longer dealing with list passed in as parameter.
 - It's like the URL you are using is pointing to a different page. (You have assigned the luggage tag to a new value in function.)
 - At that point you are no longer changing parameter passed in

```
def create_new_list(num_list):  
    num_list.append(9)  
    num_list = [1, 2, 3]  
  
def main():  
    values = [5, 6, 7, 8]  
    create_new_list(values)  
    print(values)
```

Output [5, 6, 7, 8, 9]

Note on Loops and Lists

```
list = [10, 20, 30]
```

- For loop using `range`:

```
for i in range(len(list)):  
    list[i] += 1 # Modifying list in place
```

- For-each loop:

```
for elem in list: # Modifying local variable  
    elem += 1     # elem. If elem is immutable  
                 # type, not changing list!
```

- Often use for loop with range when *modifying* elements of list (when elements are *immutable types*)
- Often use for-each loop when **not modifying** elements of list or when elements are *mutable types*

Putting it all together:
averagescores.py

Learning Goals: Images

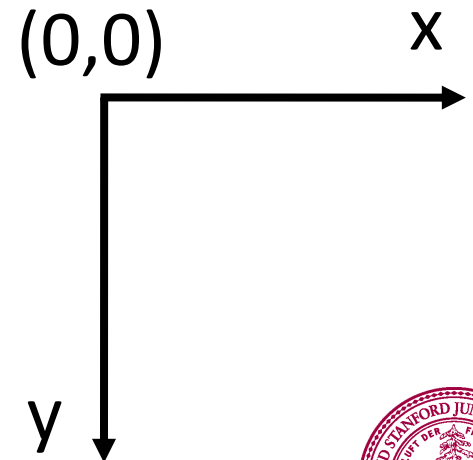

1. Understanding how images are represented
2. Learning about the SimpleImage library
3. Writing code that can manipulate images

Images

What is an Image?

- Image made of square pixels
 - Example: flower.png
- Each pixel has x and y coordinates in the image
 - The origin $(0, 0)$ is at the upper-left corner
 - y increases going down, x increases going right
- Each pixel has single color encoded as 3 **RGB** values
 - R = red; G = green; B = blue
 - Each value represents brightness for that color (red, green, or blue)
 - Can set RGB values to make any color!

Pixels in an Image Close-Up

Working with Images:
Pillow and the
SimpleImage library

Installing Pillow

- Pillow is a version of the Python Imaging Library (PIL)
 - Nick Parlante built SimpleImage library using Pillow
 - You'll be using SimpleImage in this class
 - So, you need to install Pillow first
- To install Pillow, open PyCharm Terminal tab and type (note the capital **P** in **Pillow**):
 - On a PC: `py -m pip install Pillow`
 - On a Mac: `python3 -m pip install Pillow`
 - Will see something like:
 - ...bunch of stuff...*
 - Successfully installed Pillow-9.1.0**
- Handout: Image Reference Guide contains more information

Using SimpleImage Library

- In folders for assignment or lecture on images, there is a file `simpleimage.py`
 - This is the SimpleImage library
- To use the SimpleImage library in your code, include at the top of your program file:

```
from simpleimage import SimpleImage
```

- This is importing the SimpleImage module, so that it is accessible in the code you write
 - Similar to when you used `import random` to use random number generator library

Functions in SimpleImage Library

- Create a SimpleImage object by reading an image from file (jpg, png, gif, etc.) and store it in a variable.

– Note: each SimpleImage object is made up of Pixel objects

```
my_image = SimpleImage(filename)
```

- Show the image on your computer.

```
my_image.show()
```

- We can manipulate an image by changing its pixels
- We can also create new images and set its pixels

Accessing Pixels in an Image

- We can use a "for-each" loop to access pixel in an image
- Recall basic for loop (using range):

```
for i in range(num):  
    # i will go from 0 to num - 1  
    do_something()
```

- For-each loop:

```
for item in collection:  
    # Do something with item
```

- For-each loop with image:

```
image = SimpleImage("flower.jpg")  
for pixel in image:  
    # Do something with pixel
```

For-Each Loop Over Pixels

```
image = SimpleImage("flower.jpg")
```

```
for pixel in image:
```

```
    # Body of loop
```

```
    # Do something with pixel
```

This code gets
repeated once for
each pixel in image

- Like variable `i` in `for` loop using `range()`, `pixel` is a variable that gets updated with each loop iteration.
- `pixel` gets assigned to each pixel object in the image in turn.

Properties of Images and Pixels

- Each SimpleImage image has properties you can access:
 - Can get the width and height of image (values are in pixels)
image.width, image.height
- Each pixel in an image also has properties:
 - Can get x, y coordinates of a pixel in an image
pixel.x , pixel.y
 - Can get RGB values of a pixel
pixel.red, pixel.green, pixel.blue
 - These are just integers between 0 and 255
 - Higher R, G, or B values means more of that color in pixel
 - Pixels are **mutable** objects!
 - Can **set** pixel RGB values in an image to change it!

Example: A Darker Image

```
def darker(image):  
    """  
    Makes image passed in darker by halving red, green, blue  
    values. Note: changes in image persist after function ends.  
    """  
    # Demonstrate looping over all the pixels of an image,  
    # changing each pixel to be half its original intensity.  
    for pixel in image:  
        pixel.red = pixel.red // 2  
        pixel.green = pixel.green // 2  
        pixel.blue = pixel.blue // 2  
  
def main():  
    flower = SimpleImage('images/flower.png')  
    darker(flower)  
    flower.show()
```

Image objects are mutable (like lists). If you change one in a function, the changes persist after function ends.

Example: Get Red Channel

```
def red_channel(filename):  
    """  
    Reads image from file specified by filename.  
    Changes the image as follows:  
    For every pixel, set green and blue values to 0  
    yielding the red channel.  
    Return the changed image.  
    """  
    image = SimpleImage(filename)  
    for pixel in image:  
        pixel.green = 0  
        pixel.blue = 0  
    return image
```

Example: Grayscale

```
def compute_luminosity(red, green, blue):  
    """  
    Calculates luminosity of a pixel using NTSC formula.  
    """  
    return (0.299 * red) + (0.587 * green) + (0.114 * blue)  
  
def grayscale(filename):  
    """  
    Read image from file specified by filename. Change image to  
    grayscale using the NTSC luminosity formula and return it.  
    """  
    image = SimpleImage(filename)  
    for pixel in image:  
        lum = compute_luminosity(pixel.red, pixel.green, pixel.blue)  
        pixel.red = lum  
        pixel.green = lum  
        pixel.blue = lum  
    return image
```

Let's take it out for a spin!
imageexamples.py

Greenscreening

What is Greenscreening?

- Like the movies (and Zoom backgrounds)
 - Have original image with areas that are "sufficiently green."
 - Replace "green" pixels with pixels from corresponding x, y locations in another image

What is Greenscreening?

- Like the movies (and Zoom backgrounds)
 - Have original image with areas that are "sufficiently green."
 - Replace "green" pixels with pixels from corresponding x, y locations in another image

INTENSITY_THRESHOLD = 1.6

```
def greenscreen(main_filename, back_filename):  
    image = SimpleImage(main_filename)  
    back = SimpleImage(back_filename)
```

What is Greenscreening?

- Like the movies (and Zoom backgrounds)
 - Have original image with areas that are "sufficiently green."
 - Replace "green" pixels with pixels from corresponding x, y locations in another image

```
INTENSITY_THRESHOLD = 1.6
```

```
def greenscreen(main_filename, back_filename):  
    image = SimpleImage(main_filename)  
    back = SimpleImage(back_filename)  
    for pixel in image:
```

What is Greenscreening?

 - Have original image with areas that are "sufficiently green."
 - Replace "green" pixels with pixels from corresponding x, y locations in another image

```
INTENSITY_THRESHOLD = 1.6
```

```
def greenscreen(main_filename, back_filename):  
    image = SimpleImage(main_filename)  
    back = SimpleImage(back_filename)  
    for pixel in image:  
        average = (pixel.red + pixel.green + pixel.blue) // 3  
        # See if this pixel is "sufficiently" green  
        if pixel.green >= average * INTENSITY_THRESHOLD:  
            # If so, overwrite pixel in original image with  
            # corresponding pixel from the back image.  
            x = pixel.x  
            y = pixel.y  
            image.set_pixel(x, y, back.get_pixel(x, y))  
    return image
```

Let's try it!

(But using red instead of green)

Learning Goals

1. Understanding how images are represented
2. Learning about the SimpleImage library
3. Writing code that can manipulate images
