Ethics of Data Analysis: Choices, Values, and Burritos
Assignment 6: Sneak Preview
Learning Goals

1. Explore how Choices Embed Values
2. Define “Bias” & “Fairness”
3. Distinguish Normative from Descriptive
4. Problem Formulation, Representation & Long Tail
Assignment 5: Ratings

QUALITY

5.0

106A 😊 AWESOME

For Credit: Yes  Textbook: Yes

Mehran Sahami, what Stanford is all about, great teaching, new ideas, helping you ask big questions and build awesome stuff.

DIFFICULTY

4.0

Are These Ratings Biased?

Mehran Sahami, what Stanford is all about, great teaching, new ideas, helping you ask big questions and build awesome stuff.
What is in the Dataset?
You Have The Power to Find Out: CS Skills
You Have The Power to Find Out:

Ethics Skills

CS Skills
Bias: difference between measured results and "true" value
What is Bias?

Bias: difference between measurement results and “true” value
What is Bias?

Bias: difference between measurement results and “true” value
What is Bias?

Bias: difference between measurement results and "true" value

"Sampling Bias"

Statistical Bias: learn more in future computer science & statistics classes!
What is Bias?

Bias: difference between measurement results and “true” value

What kinds of bias raise ethical concerns?
Discriminatory Bias

Biased measurement or classification + use of that bias to compound existing injustice or fail to treat all as having equal moral worth

=> Unfair Bias
How might this definition of work in ratings?

Unfair Bias in Ratings
Equality of Opportunity: everyone has same opportunity to develop skills needed for the job, apply for the job, and get promoted.
Parity: Equality of Numbers

Parity: Everyone is equally likely to be a good teacher, so we should expect to end up with number of good teachers equal to population. Parity-fair ratings should reflect this.
Measures of Fairness

Simulating loan decisions for different groups
Drag the black threshold bars left or right to change the cut-offs for loans. Click on different preset loan strategies.

### Loan Strategy
Maximize profit with:
- **MAX PROFIT**
  No constraints
- **GROUP UNAWARE**
  Blue and orange thresholds are the same
- **DEMOGRAPHIC PARITY**
  Same fractions blue / orange loans
- **EQUAL OPPORTUNITY**
  Same fractions blue / orange loans to people who can pay them off

### Blue Population
- **loan threshold: 59**
  - denied loan / would default
  - granted loan / defaults
  - granted loan / pays back

### Orange Population
- **loan threshold: 53**
  - denied loan / would default
  - granted loan / defaults
  - granted loan / pays back

Piech + Sahami, CS106A, Stanford University
Chris Piech is everything! A natural teacher who loves his material and gets students to love it too. I want to be all that, do what he does, live that amazing life of being a great teacher at the world's greatest CS department.
### Evaluation Beyond the Numbers

**NATURAL TEACHER**

Descriptive or Normative?

NATURAL TEACHER

For Credit: Yes  Attendance: Mandatory  Would Take Again: Yes  Grade: A  Textbook: Yes

Chris Piech is everything! A natural teacher who loves his material and gets students to love it too. I want to be all that, do what he does, live that amazing life of being a great teacher at the world's greatest CS department.
Both descriptive and normative:

- brave (foolhardy)
- cowardly (cautious)
- kind, rude, chill, etc.

Descriptive vs. Normative
Thick Normative Terms

“Thick” normative terms are both descriptive AND normative:

• brave : foolhardy
Thick Normative Terms

“Thick” normative terms are both descriptive AND normative:

• brave : foolhardy

• Cowardly :

[Image of a sign divided into two sections: one labeled 'Descriptive' and the other 'Normative']
“Thick” normative terms are both descriptive AND normative:

- brave : foolhardy
- Cowardly : cautious
- Polite : (?)
- rude : (?)
- chill
- kind
- etc
Thick Normative Terms & Fairness

• We compare people in many ways, not just numerically

• Thick normative terms express “loaded” judgments
Mark Zuckerberg on whether Facebook would fact-check false claims about election suppression:

1. “We have a different policy, I think, than Twitter on this.”

2. “You know, I just believe strongly that Facebook shouldn’t be the arbiter of truth of everything that people say online.”

3. “I think in general private companies probably shouldn’t be—or, especially these platform companies—shouldn’t be in the position of doing that.”
Are These Claims Descriptive or Normative?

Not surprising that statements setting the policy for platforms would be normative. What about the programs behind the platforms themselves?

**Do programs like the ones you are writing contain normative claims or values?**
How are values embedded in design?
1. Problem Formulation Embeds Values

1. “Sandcastle” (warm-up) problem: Finding forest fires.
We’re going to start by writing a function called `highlight_fires` (in the file `forestfire.py`) that highlights the areas where a forest fire is active. You’re given a satellite image of Greenland’s 2017 fires (photo credit: Stef Lhermitte, Delft University of Technology). Your job is to detect all of the “sufficiently red” pixels in the image, which are indicative of where fires are burning in the image. As we did in class with the “redscreening” example, we consider a pixel “sufficiently red” if its red value is greater than or equal to the average of the pixel’s three RGB values times some intensity threshold. In this case, we have provided you with an appropriate intensity threshold of 1.05 via a constant named `INTENSITY_THRESHOLD` in the file `forestfire.py`. Note that this is a different intensity threshold value than we used in class for the “redscreening” example, as different applications often require different intensity threshold.

When you detect a “sufficiently red” pixel in the original image, you set its red value to 255 and its green and blue values to 0. This will highlight the pixel by making it entirely

Formulating a problem means describing the desired solution as good or worthy of being done.
Formulating a problem means describing the desired solution as good or worthy of being done.

• What is the problem to be solved?

• For whom is this a problem? Who would benefit from its solution?

• Who can agree that this is a problem worth solving?
“Homeless people are sleeping here and we (who is we?) want them to stop”
What is the problem to be solved?

“Homeless people are sleeping here and we (who is we?) want them to stop”
What is the problem to be solved?

“Homeless people are sleeping here and we (who is we?) want them to stop”

“Some people in our community don’t have a place to sleep and we (who is we?) think they should”
What is the problem to be solved?

“Homeless people are sleeping here and we (who is we?) want them to stop”

“Some people in our community don’t have a place to sleep and we (who is we?) think they should”
What is the Problem to be Solved?

For whom are these problems? Who would benefit from their solution(s)?

For each problem, who can agree that the problem is worth solving?
2. Choice of Data Embeds Values

- Surveys are cheap to run
- They measure opinions
- What are other ways to measure quality of professors?
Unicode & Representation

Covers over 1 million symbols,
Full coverage of 90 languages,
basic coverage for 200 languages

Everyone in the world should be able to use their own language on phones and computers.

UNICODE: SUCCESSFUL PROCESS FOR IMPROVEMENT

WELCOME TO THE SCRIPT ENCODING INITIATIVE

The Script Encoding Initiative (SEI), established in the UC Berkeley Department of Linguistics in April 2002, is a project devoted to the preparation of formal proposals for the encoding of scripts and script elements not yet currently supported in Unicode (ISO/IEC 10646).

Unicode is the universal computing standard specifying the representation of text in all modern software. To date, Unicode has largely focused on the major modern scripts, particularly those scripts most widely used in business. Some minority and historic scripts have already been encoded, as well as historic characters of the major modern scripts.

The goal of the SEI project is to fund the preparation of script proposals that will be successfully approved by the Unicode Technical Committee and WG2 (ISO/IEC 10646) without requiring extensive revision or involvement of the committee itself.

A secondary goal is to encourage the creation of freely-available Unicode-conformant fonts. This will help to promote widespread adoption and implementation of the scripts.

By providing funding for proposal authors, drawn from faculty and graduate students as well as other experts, the Script Encoding Initiative represents a concerted effort to tackle the remaining scripts and remaining script issues. The project will be assisted by a Unicode Vice President to assure that the proposals meet requirements of the Unicode Technical Committee and of the international standards community. To date, the project has helped get over 70 scripts encoded.

The Script Encoding Initiative project is of world-wide importance, for minority and historic scripts. For a minority language, having its script included in the universal character set will help to promote native-language education, universal literacy, cultural preservation, and remove the linguistic barriers to participation in the technological advancements of computing. For historic scripts, it will serve to make communication easier, opening up the possibilities of online education, research, and publication.

Over 100 scripts remain to be encoded. Minority scripts are still used in parts of South and Southeast Asia, Africa, and the Middle East. Unencoded scripts include Kpelle and Loma. Scripts of historical significance include Book Pahlavi, Large Khitan, and Jurchen. Even for major modern scripts there are many difficult historical issues remaining to be addressed: for example, the...
Unicode is a success story in (at least) two ways

**Inclusive and Representative**

- Covers languages spoken by at least 95% of people in the world.

**Successful Process for Improvement**

- Unicode has an open-source process by which scholars and speakers of small languages can propose additional scripts.
Compare successes of Unicode with web-based NLP, text and translation services, which work best for well-resourced languages and people.
Underrepresentation & The Long Tail
Representation & Surveys
If I had a different experience, my ratings may not affect the numerical average – but they matter!
I want to see myself represented in search in my own terms, but other people are using different terms to describe me.
