# Assignment 3

**META**  
ACADEMY

```
MetaAcademy  
Console  
Welcome to Meta Academy. Coming online soon...  
1. Demo recursion by definition  
2. Demo recursion for fractals  
3. Demo recursion for exploration  
4. Personal curriculum  
5. Generate question  
6. Exit  
What do you want?
```

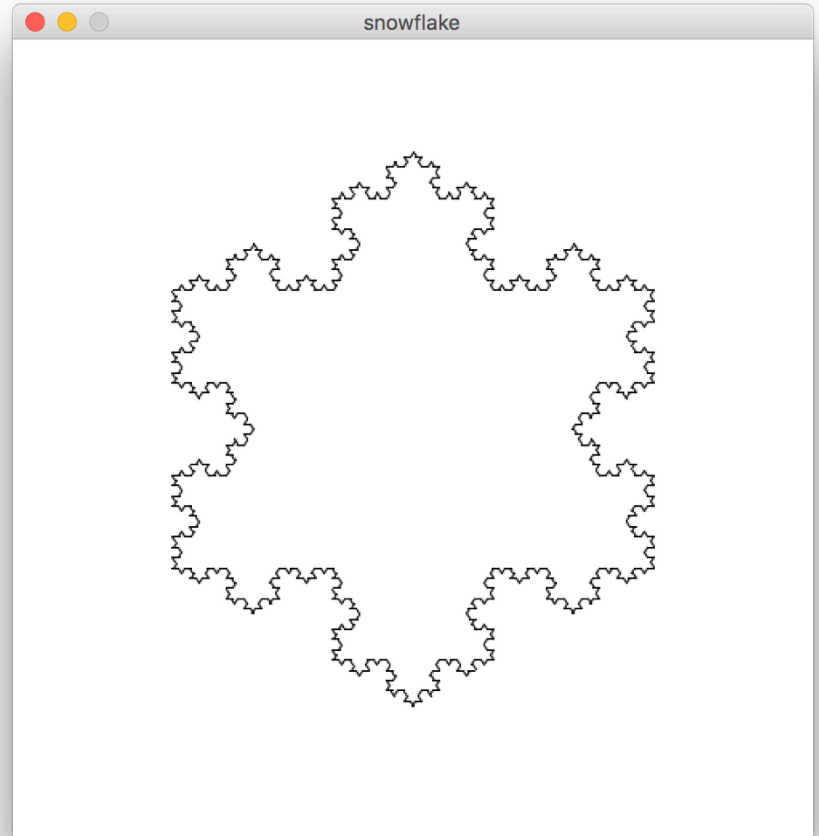

In order to learn recursion, you will teach recursion.  
In order to teach recursion, you must first learn recursion.

# Decision Tree Search

```
bool search(currentState) {  
    if(isSolution(currentState)) {  
        return true;  
    } else {  
        for(option : moves from currentState) {  
            nextState = takeOption(curr, option);  
            if(search(nextState)) {  
                return true;  
            }  
        }  
        return false;  
    }  
}
```

# Reducible Word

Let's define a **reducible word** as a word that can be reduced down to one letter by removing one character at a time, leaving a word at each step.

- **Base Cases:**

- The empty string

- **Recursive Step:**

- Any multi-letter word is reducible if you can remove a letter (legal move) to form a shrinkable word.

# Decision Tree Search

```
bool reducible(Lexicon & lex, string word) {
    if(word.length()==1 && lex.contains(word)){
        return true;
    } else {
        for(int i=0; i < word.length(); i++) {
            string copy = word;
            copy.erase(i, 1);
            if(lex.contains(copy)){
                if(reducible(lex, copy)){
                    return true;
                }
            }
        }
        return false;
    }
}
```

# Decision Tree Search

```
bool reducible(Lexicon & lex, string word) {
    if(word.length()==1 && lex.contains(word)) {
        return true;
    } else {
        for(int i=0; i < word.length(); i++) {
            string copy = word;
            copy.erase(i, 1);
            if(lex.contains(copy)) {
                if(reducible(lex, copy)) {
                    return true;
                }
            }
        }
        return false;
    }
}
```

Get all legal moves, and corresponding next states

# Decision Tree Search

```
bool reducible(Lexicon & lex, string word) {  
    if(word.length()==1 && lex.contains(word)) {  
        return true;  
    } else {  
        for(int i=0; i < word.length(); i++) {  
            string copy = word;  
            copy.erase(i, 1);  
            if(lex.contains(copy)) {  
                if(reducible(lex, copy)) {  
                    return true;  
                }  
            }  
        }  
        return false;  
    }  
}
```

Get all legal moves, and corresponding next states

# Decision Tree Search

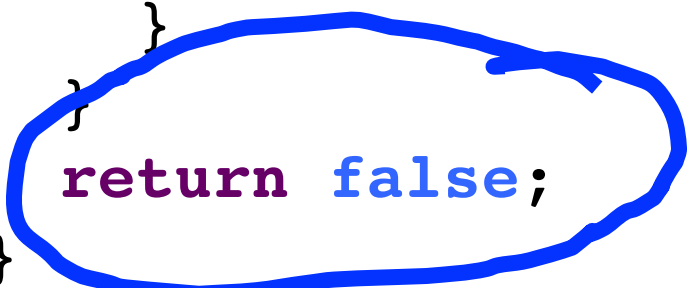

```
bool reducible(Lexicon & lex, string word) {  
    if(word.length()==1 && lex.contains(word)) {  
        return true;  
    } else {  
        for(int i=0; i < word.length(); i++) {  
            string copy = word;  
            copy.erase(i, 1);  
            if(lex.contains(copy)) {  
                if(reducible(lex, copy)) {  
                    return true;  
                }  
            }  
        }  
        return false;  
    }  
}
```

If any decision  
is reducible  
return true

# Decision Tree Search

```
bool reducible(Lexicon & lex, string word) {  
    if(word.length()==1 && lex.contains(word)) {  
        return true;  
    } else {  
        for(int i=0; i < word.length(); i++) {  
            string copy = word;  
            copy.erase(i, 1);  
            if(lex.contains(copy)) {  
                if(reducible(lex, copy)) {  
                    return true;  
                }  
            }  
        }  
        return false;  
    }  
}
```

Only return false if every single option failed.

Is there **really** just one nine-letter word with this property?

# Recursive Exploration

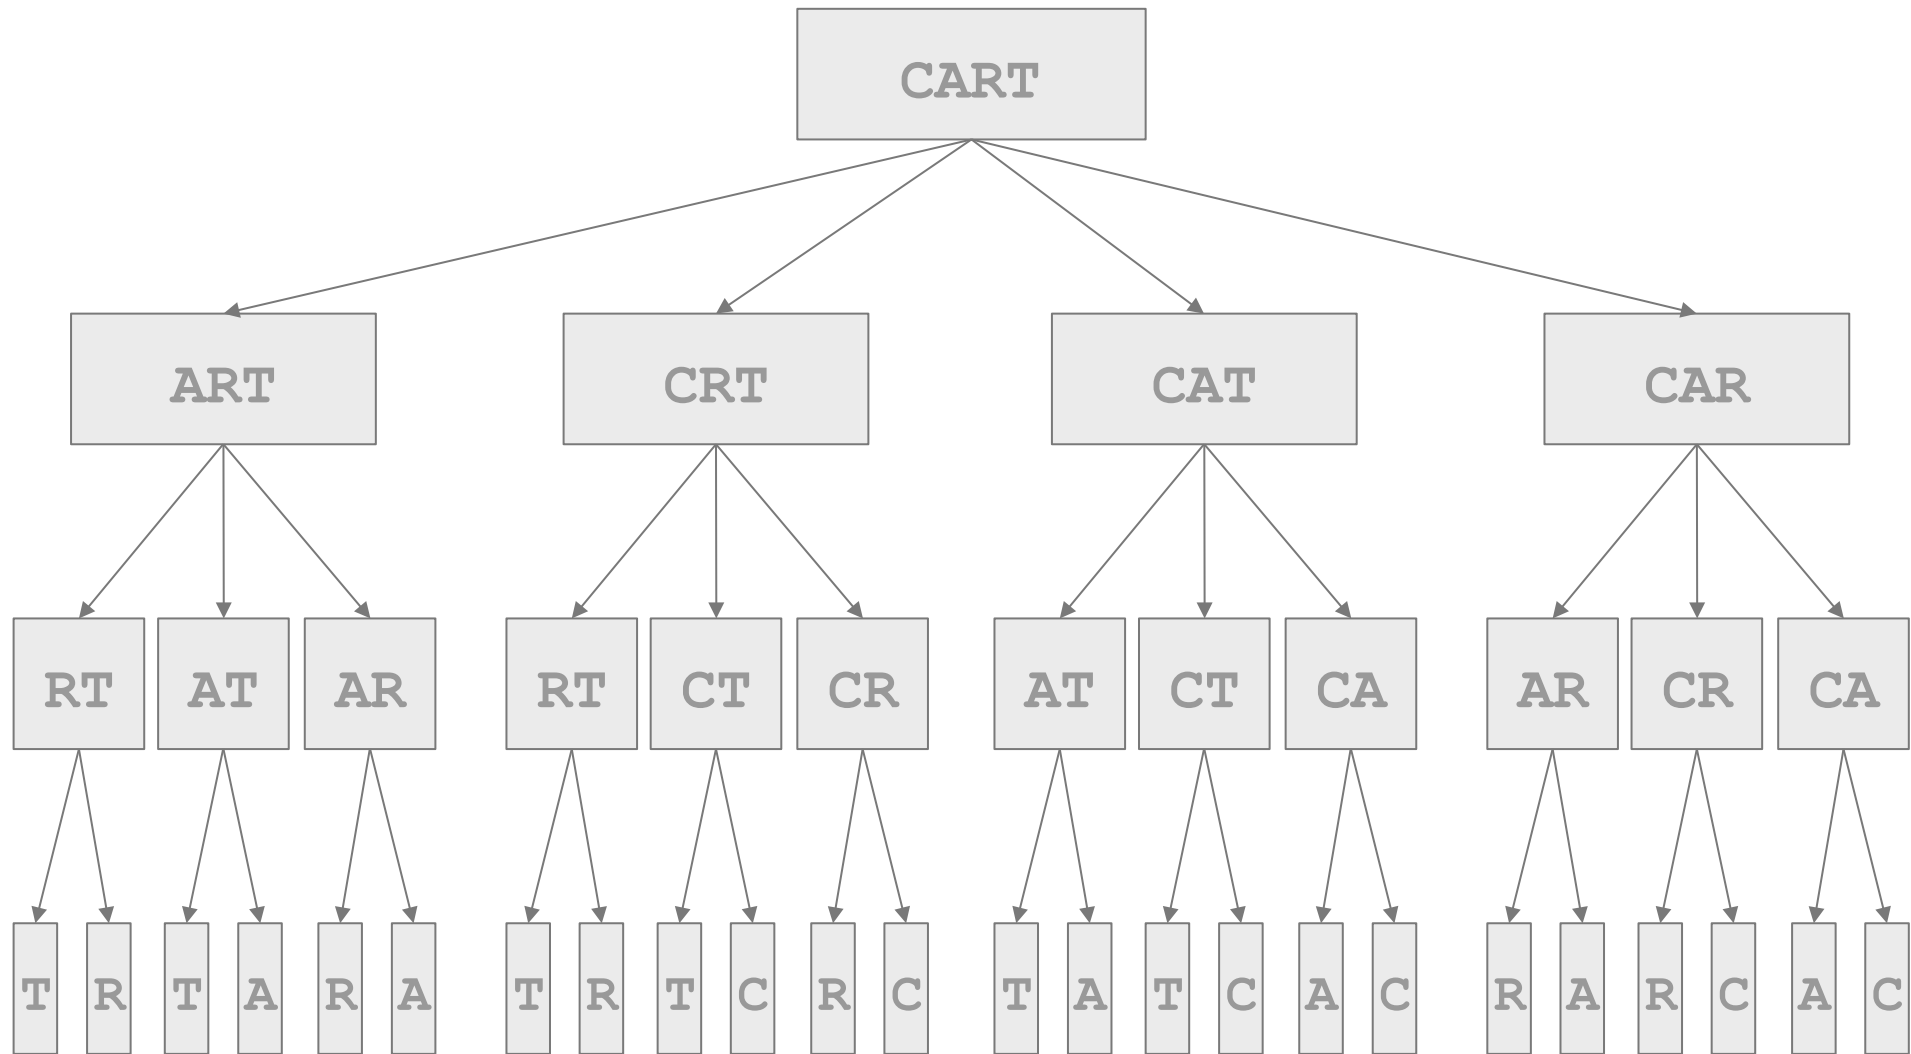

The function we have just defined is an example of **recursive exploration**. In this case we are looking for any path through the decision tree. For a given state:

- If *any* option leads to succeeds, that's great! We're done.
- If *none* of the options succeed, then this particular problem can't be solved from the state.

# How to Formulate as Decision Tree

1. How do you represent a current state?

2. How do you calculate legal moves?

3. How do you generate next states given move?

4. How do you know if you should stop recursing?
