

**A tutorial introduction to  
the QT Creator debugger**

**written by Keith Schwarz**

# Assignment 0: Using the Debugger

Hi everybody!

As part of Assignment 0, we'd like you to get a little bit of practice using the debugger in Qt Creator.

The debugger is a tool you can use to help see what your program is doing as you run it.

It's really useful for helping find errors in your programs, and the more practice you get with it, the easier it'll be to correct mistakes in the programs you write.

Think of this guide as a little tutorial walkthrough to help give you a sense of how to use the debugger and how to make sense of what you're seeing.

To start things off, open up the Name Hash program you ran in Part One of this assignment. Scroll down to the nameHash function so that you can see the entire function in your window.

```
39 * th
40 * of
41 *
42 * Fo
43 * treat
44 * It then uses them as coefficients in a polynomial over
45 * F_p, where p is a large prime number, and evaluates the
46 * some smaller prime number q. (You aren't expected to know
47 * but we thought it might be fun!)
48 */
49 int nameHash(string first, string last){
50     /* This hashing scheme needs two prime numbers, a large prime and a small
51     * prime. These numbers were chosen because their product is less than
52     * 2^31 - kLargePrime - 1.
53     */
54     static const int kLargePrime = 16908799;
55     static const int kSmallPrime = 127;
56
57     int hashVal = 0;
58
59     /* Iterate across all the characters in the first name, then the last
60     * name, updating the hash at each step.
61     */
62     for (char ch: first + last) {
63         /* Convert the input character to lower case. The numeric values of
64         * lower-case letters are always less than 127.
65         */
66         ch = tolower(ch);
67         hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68     }
69     return hashVal;
70 }
71
```

39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
```

Move your mouse cursor so that it's in the space right before the line number for line 66.

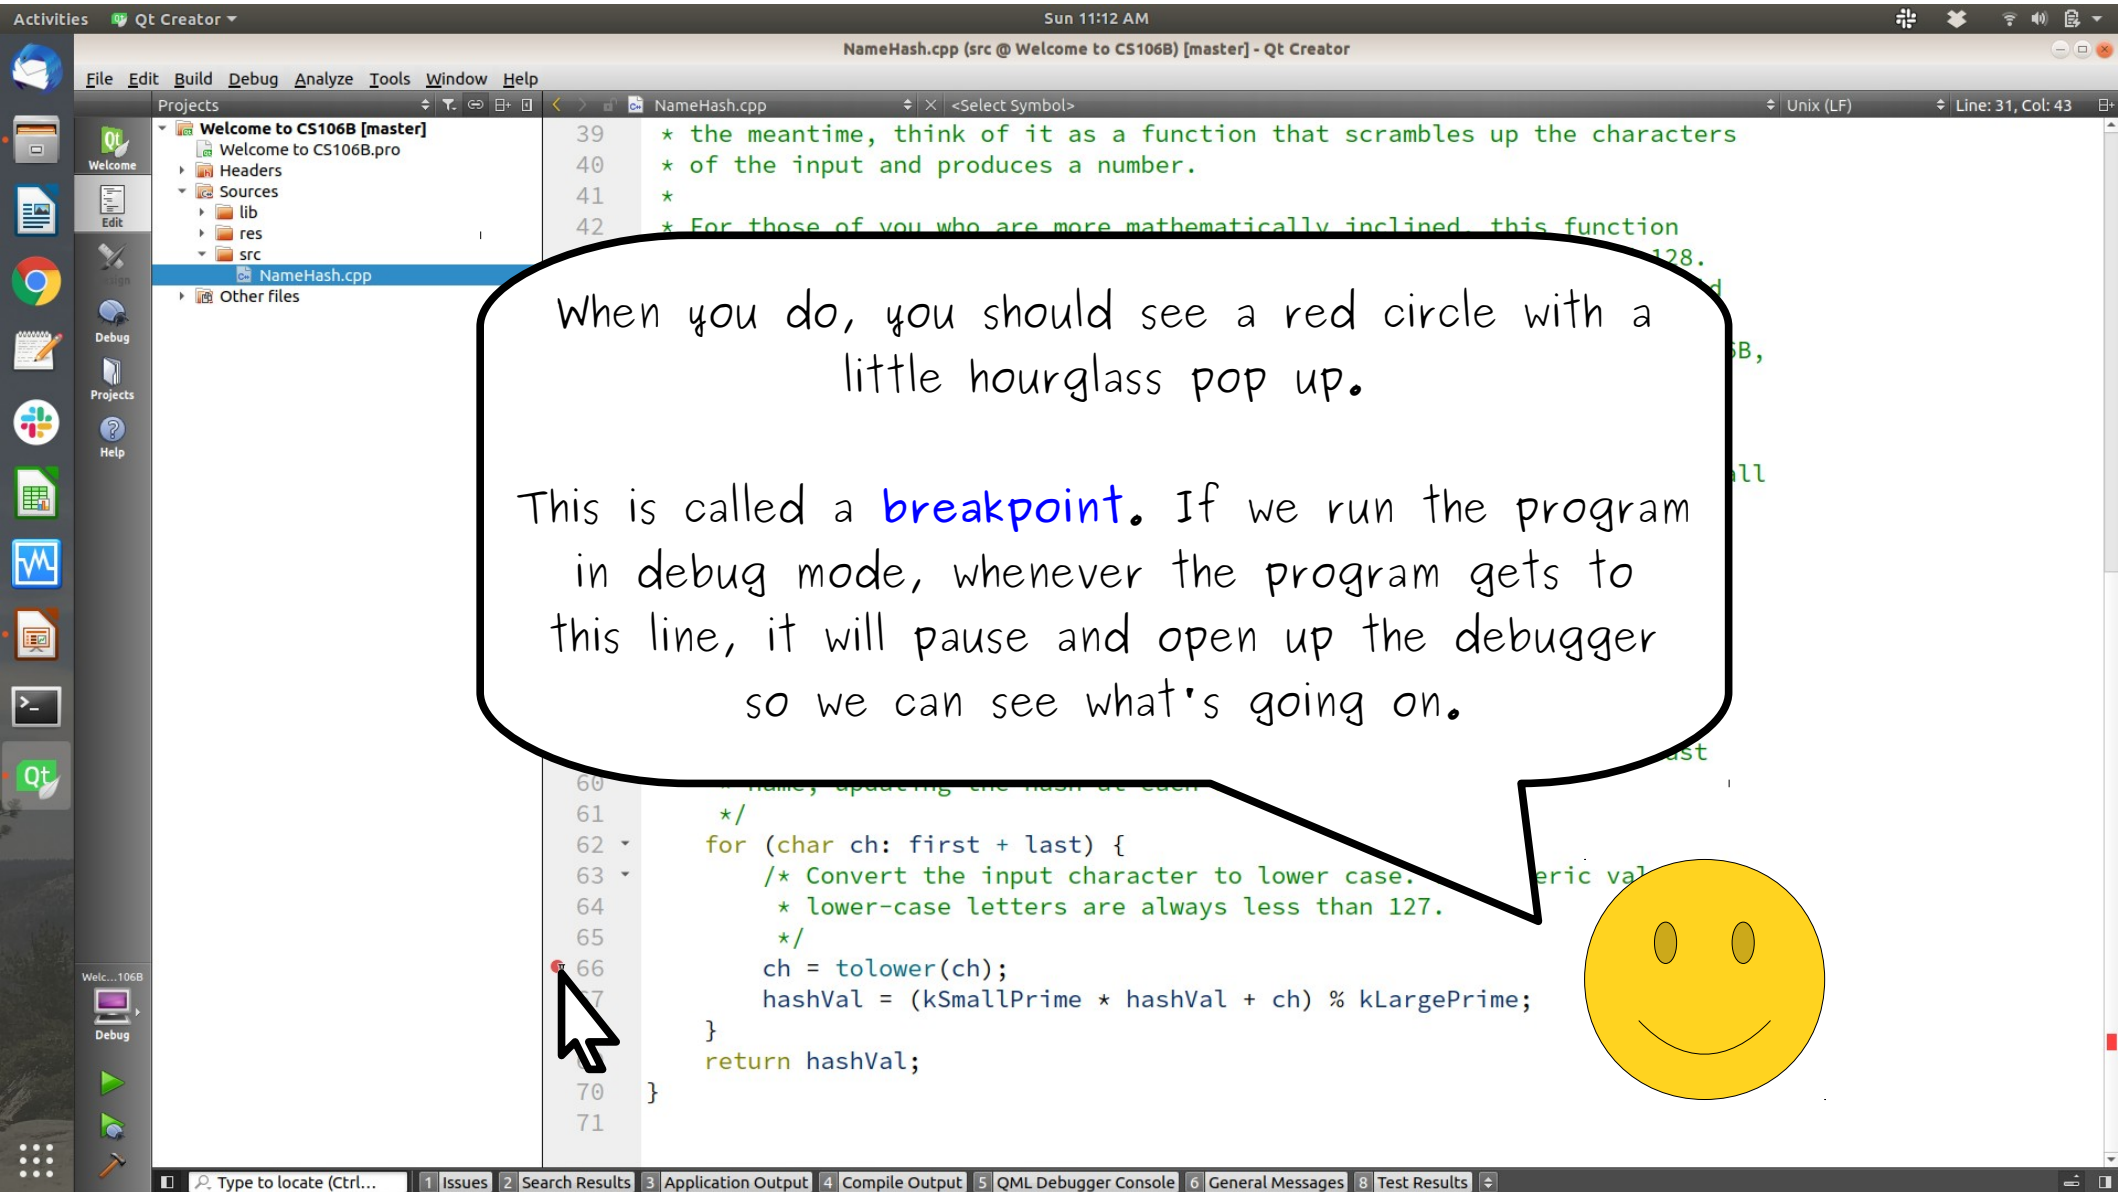

Now, click the mouse!

```
55 static const int kSmallPrime =
56
57 int hashVal = 0;
58
59 /* Iterate across all the characters in the first name
60 * name, updating the hash at each step.
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case. The number of
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71
```

- Activities
- Qt Creator
- Welcome
- Edit
- Debug
- Projects
- Help
- Qt

When you do, you should see a red circle with a little hourglass pop up.

This is called a **breakpoint**. If we run the program in debug mode, whenever the program gets to this line, it will pause and open up the debugger so we can see what's going on.

Projects

- Welcome to CS106B [master]
  - Welcome to CS106B.pro
  - Headers
  - Sources
    - lib
    - res
    - src
      - NameHash.cpp
  - Other files

```
39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
45 * F_p, where p is a large prime number, and evaluates that polynomial at
46 * some smaller prime number q. (You aren't expected to know this for CS106B,
47 * but we thought it might be fun!)
48 */
```

Now, we're going to run this program in debug mode. To do so, click on the "run in debug mode" button in the bottom-~~right~~<sup>left</sup> corner of the screen. It's the one just below the regular green "run" button. When you do...

```
60 // name, updating the hash at each
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case.
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71
```

Qt

Debug

Run in debug mode button (blue bug icon)

... you should see something like this! Notice that a bunch of extra panels popped up in Qt Creator. We'll talk about what each of these windows mean in a second.

The screenshot shows the Qt Creator IDE interface. The main editor displays a C++ file named `NameHash.cpp` with the following code:

```
48 */
49 int nameHash(string first, string last){
50     /* This hashing scheme needs two prime numbers, a large prime and a small
51     * prime. These numbers were chosen because their product is less than
52     * 2^31.
53     */
54     stat
55     stat
56     What is your first name?
57     int
58
59     /* I
60     * n
61     */
62     for
63
64
65
66
67
68     }
69     retu
70 }
71
```

The console window shows the prompt "What is your first name?". A yellow smiley face is overlaid on the console window.

The debugger window shows the following table:

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads
1	...ring)	...eHash.cpp	66					...555892674			(all)

The bottom status bar shows the following tabs: 1 Issues, 2 Search Results, 3 Application Output, 4 Compile Output, 5 QML Debugger Console, 6 General Messages, 8 Test Results.

In the meantime, type in the first name **Ada** and hit enter, as shown here.

```
48  */
49  int nameHash(string first, string last){
50  /* This hashing scheme needs two prime numbers, a large prime and a small
51  * prime. These numbers were chosen because their product is less than
52  * 2^31.
53  */
54  stat
55  stat
56  What is your first name? Ada
57  int What is your last name?
58
59  /* I
60  * n
61  */
62  for
63
64
65
66
67
68  }
69  retu
70  }
71
```

Name	Value	Type

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads
1	...	...eHash.cpp	66	...	...	...	66	...555892674			(all)

Now, type in **Lovelace** as a last name, but  
don't hit enter yet!

```
48 */
49 int nameHash(string first, string last){
50     /* This hashing scheme needs two prime numbers, a large prime and a small
51     * prime. These numbers were chosen because their product is less than
52     * 2^31.
53     */
54     stat
55     stat
56     int
57     int
58     /* I
59     * n
60     */
61     */
62     for
63     for
64
65
66
67
68     }
69     retu
70 }
71
```

Console

What is your first name? **Ada**  
What is your last name? **Lovelace**

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads
• 1	...ring)	...eHash.cpp	66					...555892674			(all)

As soon as you hit enter, a bunch of things are going to pop up in Qt Creator. Don't panic! It's normal.

The screenshot shows the Qt Creator IDE with a C++ project named "Welcome to CS106B". The main editor displays the following code:

```
48  */
49  int nameHash(string first, string last){
50      /* This hashing scheme needs two prime numbers, a large prime and a small
51      * prime. These numbers were chosen because their product is less than
52      * 2^31. This is the maximum value of an int.
53      */
54      stat
55      stat
56      int
57      int
58      /* I
59      * n
60      */
61      */
62      for
63      for
64
65
66
67
68      }
69      retu
70  }
71
```

The console window shows the program's output:

```
File Edit Options Help
What is your first name? Ada
What is your last name? Lovelace
```

A yellow smiley face is drawn over the console output. The debugger window at the bottom shows the application has started, with a table of execution details:

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads
1	...	...ring)	... <td>66</td> <td></td> <td></td> <td></td> <td>...555892674</td> <td></td> <td></td> <td>(all)</td>	66				...555892674			(all)

The bottom status bar shows the following tabs: 1. Type to locate (Ctrl...), 2. Issues, 3. Search Results, 4. Application Output, 5. Compile Output, 6. QML Debugger Console, 7. General Messages, 8. Test Results.

With that said, hit enter,  
and watch the magic happen!

The screenshot shows the Qt IDE interface. The main editor displays the following C++ code:

```
48  */
49  int nameHash(string first, string last){
50  /* This hashing scheme needs two prime numbers, a large prime and a small
51  * prime. These numbers were chosen because their product is less than
52  * 2^31.
53  */
54  stat
55  stat
56
57  int
58
59  /* I
60  * n
61  */
62  for
63
64
65
66
67
68  }
69  retu
70  }
71
```

The console window shows the program's output:

```
File Edit Options Help
What is your first name? Ada
What is your last name? Lovelace
```

A yellow smiley face is overlaid on the console window.

The debugger window at the bottom shows the application has started:

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads
1	...ring)	...eHash.cpp	66					...555892674			(all)

The bottom status bar shows the following tabs: 1. Type to locate (Ctrl...), 2. Issues, 3. Search Results, 4. Application Output, 5. Compile Output, 6. QML Debugger Console, 7. General Messages, 8. Test Results.

Shazam! We're back in Qt Creator, and there's tons of values showing up everywhere.

```
48  */
49  int nameHash(string first, string last){
50  /* This hashing scheme needs two prime numbers, a large prime and a small
51  * prime. These numbers were chosen because their product is less than
52  * 2^31 - kLargePrime - 1.
53  */
54  static const int kLargePrime = 16908799;
55  static const int kSmallPrime = 127;
56
57  int hashVal = 0;
58
59  /* Iterate across all the characters in the first name, then the
60  * name, updating the hash at each step.
61  */
62  for (char ch: first + last) {
63  /* Convert the input character to lower case. The numeric values of
64  * lower-case letters are always less than 127.
65  */
66  ch = tolower(ch);
67  hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68  }
69  return hashVal;
70  }
71

Generally speaking, you can use the call stack as a way to see which function calls got us to the point where the program paused at the breakpoint!

Debugger GDB for "Welcome to CS106B" Stopped at breakpoint 1 in thread 7.

Level	Function	File	Line	Number	Function	File	Line	Address	Condition	Ignore	Threads

```

19 #include "simpio.h" // for getLine
20 using namespace std;
21
22 /* Prototype for the nameHash function. This lets us use the function
23  * in main and then define it later in the program.
24  */
25 int nameHash(string first, string last);
26
27 int main() {
28     string first = getLine("What is your first name? ");
29     string last = getLine("What is your last name? ");
30
31     int hashValue = nameHash(first, last);
32
33     cout << "The hash of your name is: " << hashValue << endl;
34     return 0;
35 }
36
37 /* This
38  * to ta
39  * the m
40  * of th
41  *
42  * For those
43  * treats each character in the input name as a number between 0 and 128.
44  * It then uses them as coefficients in a polynomial over the finite field

```

Let's find out! Double-click on the function on Level 3. (Here's what it looks like on my system; you might see something different.)

Now, let's take a look at this for loop.

```
47
48 */
49 int nameHash(string first, string last){
50     /* This hashing scheme needs two prime numbers, a large prime and a small
51     * prime. These numbers were chosen because their product is less than
52     * 2^31 - kLargePrime - 1.
53     */
54     static const int kLargePrime = 16908799;
55     static const int kSmallPrime = 127;
56
57     int hashVal = 0;
58
59     /* Iterate across all the characters in the first name, then the last
60     * name, updating the hash at each step.
61     */
62     for (char ch: first + last) {
63         /* Convert the input character to lower case. The numeric values of
64         * lower-case letters are always less than 127.
65         */
66         ch = tolower(ch);
67         hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68     }
69     return hashVal;
70 }
71
```

The for loop in the code above is highlighted with a dashed blue box.

56
57     int hashVal = 0;
58
59     /* Iterate across all the characters in the first name, then the last
60     * name, updating the hash at each step.
61     */
62     for (char ch: first + last) {
63         /* Convert the input character to lower case. The numeric values of
64         * lower-case letters are always less than 127.
65         */
66         ch = tolower(ch);
67         hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68     }
69     return hashVal;
70 }
71
```

Name	Value
__for_begin	65 'A'
__for_end	0 '\000'
__for_range	"AdaLovelace"
ch	'a' 97
first	"Ada"
hashVal	0
kLargePrime	16908799
kSmallPrime	127
last	"Lovelace"

This line converts ch to lower case. The tolower function takes in a character and returns a lower-case version of it, so this overwrites ch with a lower-case version of itself.

Help

You can actually see this by looking at the values panel over on the side!

```

55
56
57 int hashVal = 0;
58
59 /* Iterate across all the characters in the first name, then the last
60 * name, updating the hash at each step.
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case. The numeric values of
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71

```

This indicates that the value here has changed since the previous step. This is a really useful way to keep track of what's changing as you run the program.

```

55
56
57 int hashVal = 0;
58
59 /* Iterate across all the characters in the first name, then the last
60 * name, updating the hash at each step.
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case. The numeric values of
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71

```

Not gonna lie, this is a pretty dense line of code. It performs some weird sort of mathematical calculation on a bunch of different values.

```

55
56
57 int hashVal = 0;
58
59 /* Iterate across all the characters in the first name, then the last
60 * name, updating the hash at each step.
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case. The numeric values of
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71

```

Fundamentally, though, it's just computing some weird function of some values and stashing it into hashVal.

```

55
56
57 int hashVal = 0;
58
59 /* Iterate across all the characters in the first name, then the last
60 * name, updating the hash at each step.
61 */
62 for (char ch: first + last) {
63     /* Convert the input character to lower case. The numeric values of
64     * lower-case letters are always less than 127.
65     */
66     ch = tolower(ch);
67     hashVal = (kSmallPrime * hashVal + ch) % kLargePrime;
68 }
69 return hashVal;
70 }
71

```

41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
```

But if you look up over here in the values window, you can see that hashValue has some really weird-looking number stored in it. (You'll almost certainly see something different on your system.)

“Really weird-looking number” is a relative term here, as the number will vary from computer to computer and may be as innocent looking as “0” or “1” or as wild as “2349980890”.

But it looks like we're setting hashValue equal to the number that was returned by the nameHash function. What's going on?

Qt Creator interface showing a C++ project named "Welcome to CS106B". The main editor displays the source file "NameHash.cpp" with the following code:

```
19 #include "simpio.h"
20 using namespace std;
21
22 /* Prototype
23 * in main
24 */
25 int nameHash(const string& first, const string& last);
26
27 int main()
28 {
29     string first;
30     string last;
31     int hashValue = nameHash(first, last);
32
33     cout << "The hash of your name is: " << hashValue << endl;
34     return 0;
35 }
36
37 /* This is the actual function that computes the hash code. We're going
38 * to talk more about what hash functions do later in the quarter. In
39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
```

The variable `hashValue` is highlighted in blue in the code. The right-hand side of the editor shows a variable inspector window with the following data:

Name	Value	Type
first	"Ada"	std::string
hashValue	21845	int
last	"Lovelace"	std::string

The bottom of the screen shows the GDB debugger console with the following stack trace:

Level	Function	File	Line
1	qMain	Nam...	31
2	std::_Function_handler<int (), int (*)>::_M_invoke(std::_Any_data const&)	std_f...	302
3	std::function<int ()>::operator()() const	std_f...	706
4	QtGui::<lambda()>::operator()(void) const	spl.cpp	20981
5	std::_Function_handler<int (), QtGui::startBackgroundEventLoop(GThrunkin...)	std_f...	302
6	std::function<int ()>::operator()() const	std_f...	706
7	GThreadStd::run	spl.cpp	22491
8	GThreadStd::<lambda()>::operator()(void) const	spl.cpp	22514
9	std::_invoke_impl<void, GThreadStd::start()::<lambda()>>(std::_invoke_o...	invok...	60
10	std::_invoke<GThreadStd::start()::<lambda()>>(GThreadStd::<lambda()> &&)	invok...	95

The status bar at the bottom indicates the application is stopped at "function-finished".

This is pretty cool, actually!

Qt Creator interface showing a C++ project named "Welcome to CS106B". The main editor displays the source file "NameHash.cpp".

```
19 #include "simpio.h"
20 using namespace std;
21
22 /* Prototype
23 * in main a
24 */
25 int nameHash(const string& first, const string& last);
26
27 int main()
28 {
29     string first;
30     string last = getLine("What is your last name? ");
31     int hashValue = nameHash(first, last);
32
33     cout << "The hash of your name is: " << hashValue << endl;
34     return 0;
35 }
36
37 /* This is the actual function that computes the hash code. We're going
38 * to talk more about what hash functions do later in the quarter. In
39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
```

The right-hand side of the interface shows a variable inspector window with the following data:

Name	Value	Type
first	"Ada"	std::string
hashValue	21845	int
	"Lovelace"	std::string

Below the code editor is a debugger window showing the call stack:

Level	Function	File	Line
1	qMain	Nam...	31
2	std::_Function_handler<int (int (*>):_M_invoke(std::_Any_data const&)>	std_f...	302

Let's do a "step over" so that we can finish executing this line. Click "step over," and if you did everything right...

Qt Creator interface showing a C++ project named "Welcome to CS106B". The main editor displays the source file "NameHash.cpp" with the following code:

```
19 #include "simpio.h"
20 using namespace std;
21
22 /* Prototype
23 * in main
24 */
25 int nameHash(const string& s1, const string& s2);
26
27 int main() {
28     string first = getLine("What is your first name? ");
29     string last = getLine("What is your last name? ");
30
31     int hashValue = nameHash(first, last);
32
33     cout << "The hash of your name is: " << hashValue << endl;
34     return 0;
35 }
36
37 /* This is the actual function that computes the hash code. We're going
38 * to talk more about what hash functions do later in the quarter. In
39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
```

The debugger window at the bottom shows the execution stack:

Level	Function	File	Line
1	qMain	Nam...	31
2	std::Function_handler<int (), int (*)>::M_invoke(std::_Any_data const&)	std_f...	302
3	std::function<int ()>::operator()() const	std_f...	706
4	QtGui::lambda()::operator()(void) const	spl.cpp	20981
5	std::Function_handler<int (), QtGui::startBackgroundEventLoop(GThunkin...	std_f...	302
6	std::function<int ()>::operator()() const	std_f...	706
7	GThreadStd::run	spl.cpp	22491
8	GThreadStd::lambda()::operator()(void) const	spl.cpp	22514
9	std::_invoke_impl<void, GThreadStd::start()::lambda()>>(std::_invoke_o...	invok...	60
10	std::_invoke<GThreadStd::start()::lambda()>>(GThreadStd::lambda() &&)	invok...	95

The "Step Over" button in the debugger toolbar is highlighted with a red box.

... you should see the right value get stored (notice it's in red!) and we've moved to the next line.

Qt Creator interface showing a C++ project named "Welcome to CS106B". The main editor displays the source code for "NameHash.cpp".

```
21
22  /* Prototype for the function. This lets us use the function
23  * in main and the
24  */
25  int nameHash(const string& first, const string& last);
26
27  int main()
28  {
29      string first;
30      string last;
31
32      int hashValue = nameHash(first, last);
33      cout << "The hash of your name is: " << hashValue << endl;
34      return 0;
35  }
36
37  /* This is the actual function that computes the hash code. We're going
38  * to talk more about what hash functions do later in the quarter. In
39  * the meantime, think of it as a function that scrambles up the characters
40  * of the input and produces a number.
41  *
42  * For those of you who are more mathematically inclined, this function
43  * treats each character in the input name as a number between 0 and 128.
44  * It then uses them as coefficients in a polynomial over the finite field
45  * F_p, where p is a large prime number, and evaluates that polynomial at
46  * some smaller prime number q. (You aren't expected to know this for CS106B,
```

The right-hand pane shows a variable watch window with the following data:

Name	Value	Type
first	"Ada"	std::string
hashValue	1967457	int
last	"Lovelace"	std::string

The bottom pane shows the GDB debugger stack trace, currently stopped at line 33 of NameHash.cpp.

Level	Function	File	Line
1	qMain	Nam...	33

NameHash.cpp (src @ Welcome to CS106B) [master] - Qt Creator

At this point, we've seen just about everything we care about. Rather than single-stepping all the way to the end, let's just tell the program to keep on running.

```
21
22 /* Prototype
23 * in main
24 */
25 int nameHash
26
27 int main()
28     string
29     string
30
31     int hashValue = nameHash(first, last);
32
33     cout << "The hash of your name is: " << hashValue << endl;
34     return 0;
35 }
36
37 /* This is the actual function that computes the hash code. We're going
38 * to talk more about what hash functions do later in the quarter. In
39 * the meantime, think of it as a function that scrambles up the characters
40 * of the input and produces a number.
41 *
42 * For those of you who are more mathematically inclined, this function
43 * treats each character in the input name as a number between 0 and 128.
44 * It then uses them as coefficients in a polynomial over the finite field
45 * F_p, where p is a large prime number, and evaluates that polynomial at
46 * some smaller prime number q. (You aren't expected to know this for CS106B,
```

so there you have it! You've now gotten more familiar with the debugger!

You know how to set a breakpoint to pause the program at a particular point.

You know how to read the call stack and to see the values of local variables.

You know how to single-step the program and see what values change.

You know how to run a function to completion,  
and how to let the program keep on running.

As you write more and more complicated programs this quarter, you'll get a lot more familiar using the debugger and seeing how your programs work.

And, if you continue to build larger and larger pieces of software, you'll find that knowing how to use a debugger is a surprisingly valuable skill!

Hope this helps, and welcome to CS106B!
