

# CS107 Handy one-page of x86-64

## Common instructions

<b>mov</b>	<code>src, dst</code>	<code>dst = src</code>
<b>movsb</b>	<code>src, dst</code>	byte to int, sign-extend
<b>movzb</b>	<code>src, dst</code>	byte to int, zero-fill
<b>lea</b>	<code>addr, dst</code>	<code>dst = addr</code>
<b>add</b>	<code>src, dst</code>	<code>dst += src</code>
<b>sub</b>	<code>src, dst</code>	<code>dst -= src</code>
<b>imul</b>	<code>src, dst</code>	<code>dst *= src</code>
<b>neg</b>	<code>dst</code>	<code>dst = -dst (arith inverse)</code>
<b>sal</b>	<code>count, dst</code>	<code>dst &lt;= count</code>
<b>sar</b>	<code>count, dst</code>	<code>dst &gt;= count (arith shift)</code>
<b>shr</b>	<code>count, dst</code>	<code>dst &gt;= count (logical shift)</code>
<b>and</b>	<code>src, dst</code>	<code>dst &amp;= src</code>
<b>or</b>	<code>src, dst</code>	<code>dst  = src</code>
<b>xor</b>	<code>src, dst</code>	<code>dst ^= src</code>
<b>not</b>	<code>dst</code>	<code>dst = ~dst (bitwise inverse)</code>
<b>cmp</b>	<code>a, b</code>	b-a, set flags
<b>test</b>	<code>a, b</code>	a&b, set flags
<b>jmp</b>	<code>label</code>	jump to label (unconditional)
<b>je</b>	<code>label</code>	jump equal ZF=1
<b>jne</b>	<code>label</code>	jump not equal ZF=0
<b>js</b>	<code>label</code>	jump negative SF=1
<b>jns</b>	<code>label</code>	jump not negative SF=0
<b>jg</b>	<code>label</code>	jump > (signed) ZF=0 and SF=OF
<b>jge</b>	<code>label</code>	jump >= (signed) SF=OF
<b>jl</b>	<code>label</code>	jump < (signed) SF!=OF
<b>jle</b>	<code>label</code>	jump <= (signed) ZF=1 or SF!=OF
<b>ja</b>	<code>label</code>	jump > (unsigned) CF=0 and ZF=0
<b>jb</b>	<code>label</code>	jump < (unsigned) CF=1
<b>push</b>	<code>src</code>	add to top of stack <code>Mem[--%rsp] = src</code>
<b>pop</b>	<code>dst</code>	remove top from stack <code>dst = Mem[%rsp++]</code>
<b>call</b>	<code>fn</code>	push %rip, jmp to fn
<b>ret</b>		pop %rip

## Instruction suffixes

<b>b</b>	byte
<b>w</b>	word (2 bytes)
<b>l</b>	long /doubleword (4 bytes)
<b>q</b>	quadword (8 bytes)

Suffix is elided when can be inferred from operands  
e.g. operand %rax implies q, %eax implies l, and so on

## Condition codes/flags

<b>ZF</b>	Zero flag
<b>SF</b>	Sign flag
<b>CF</b>	Carry flag
<b>OF</b>	Overflow flag

## Registers

<b>%rip</b>	Instruction pointer
<b>%rsp</b>	Stack pointer
<b>%rax</b>	Return value
<b>%rdi</b>	1st argument
<b>%rsi</b>	2nd argument
<b>%rdx</b>	3rd argument
<b>%rcx</b>	4th argument
<b>%r8</b>	5th argument
<b>%r9</b>	6th argument
<b>%r10,%r11</b>	Callee-owned
<b>%rbx,%rbp,%r12-%r15</b>	Caller-owned

## Addressing modes

Example source operands to mov

### Immediate

`mov $0x5, dst`

\$val

source is constant value

### Register

`mov %rax, dst`

%R

R is register

source in %R register

### Direct

`mov 0x4033d0, dst`

0xaddr

source read from Mem[0xaddr]

### Indirect

`mov (%rax), dst`

(%R)

R is register

source read from Mem[%R]

### Indirect displacement

`mov 8(%rax), dst`

D(%R)

R is register

D is displacement

source read from Mem[%R + D]

### Indirect scaled-index

`mov 8(%rsp, %rcx, 4), dst`

D(%RB,%RI,S)

RB is register for base

RI is register for index (0 if empty)

D is displacement (0 if empty)

S is scale 1, 2, 4 or 8 (1 if empty)

source read from

`Mem[%RB + D + S*%RI]`
