• Unix and the Command Line
• Getting Started With C
Plan For Today

• Introduction
• CS107 Course Policies
• Unix and the Command Line
• Getting Started With C
What is CS107?

Computer Organization and Systems

- How languages like C++ and Java represent data under the hood
- How programming structures are encoded in bits and bytes
- How to efficiently manipulate and manage memory
- How computers compile programs
- Uses the C programming language
- Programming style and software development practices
The goals for CS107 are for students to gain mastery of
- writing C programs with complex use of memory and pointers
- an accurate model of the address space and compile/runtime behavior of C programs

To achieve competence in
- translating C to/from assembly
- writing programs that respect the limitations of computer arithmetic
- identifying bottlenecks and improving runtime performance
- working effectively in a Unix development environment

And have exposure to
- a working understanding of the basics of computer architecture
1. **Bits and Bytes** - How can a computer represent integer numbers?

2. **Chars and C-Strings** - How can a computer represent and manipulate more complex data like text?

3. **Pointers, Stack and Heap** – How can we effectively manage all types of memory in our programs?

4. **Generics** - How can we use our knowledge of memory and data representation to write code that works with any data type?

5. **Floats** - How can a computer represent floating point numbers in addition to integer numbers?

6. **Assembly** - How does a computer interpret and execute C programs?

7. **Heap Allocators** - How do core memory-allocation operations like malloc and free work?
You’ll be able to...

• Manipulate bits and bytes and work within the limits of computer arithmetic
• Implement complex algorithms using C-strings
• Re-implement existing Unix tools yourself
• Write generic C code that works with a variety of data types
• Reverse engineer executable programs without ever seeing the source code
• Find security vulnerabilities in programs
• Create your own memory allocator to manage heap memory
Companion Class: CS107A

• **CS107A** is an extra 1-unit “Pathfinders” or “ACE” section with additional course support, practice and instruction.

• Meets for an additional weekly section and has additional review sessions

• Entry by application – see the FAQ on the course website for details
Course Website

cs107.stanford.edu
Nice to meet you!

Course Assistants (CAs)

The course staff will lead labs, grade coursework, help you when you have questions, and much more!

Lecturer: Nick Troccoli
Plan For Today

• Introduction
• **CS107 Course Policies**
• Unix and the Command Line
• Getting Started With C
Textbooks

• *Computer Systems: A Programmer’s Perspective* by Bryant & O’Hallaron, *3rd Edition*
  - *3rd edition matters* – important updates to course materials

• A C programming reference of your choice
  - *The C Programming Language* by Kernighan and Ritchie (free link on course website Resources page)
  - Other C programming books, websites, or reference sheets
Grading

**** 35% Assignments
** 15% Lab Participation
** 17% Midterm Exam
**** 33% Final Exam
Grading

**** 35% Assignments
** 15% Lab Participation
** 17% Midterm Exam
**** 33% Final Exam
Assignments

• 8 programming assignments completed individually using **Unix command line tools**
  • Free software, pre-installed on Myth machines / available on course website
  • We will give out starter projects for each assignment

• Graded on **functionality** (behavior) and **style** (elegance)
  • Functionality graded using **automated tools**, given as point score
  • Style graded via **automated tests** and TA code review, given as bucket score
  • Grades returned via course website

Getting Help

• Post on Piazza
  • Online discussion forum for students; post questions, answer other students’ questions
  • Best for course material discussions, course policy questions or general assignment questions (DON’T POST ASSIGNMENT CODE!)

• Visit us at office hours
  • Scheduled throughout the week; schedule will be posted on course website tomorrow
  • Best for coding/debugging questions, or longer course material discussions
  • SCPD students can call in to SCPD office hours – more information coming soon

• Email the Course Staff
  • cs107@cs.stanford.edu – please do not email CAs individually
  • Best for private matters (e.g. grading questions, OAE accommodations).
Late Policy

• Submitting by the assignment deadline typically earns an extra-credit on-time bonus, usually ~5%.

• If you miss the deadline, there may be a grace period for late submissions, typically 48 hours, but submitting during the grace period does not earn any on-time bonus.

• “Pre-granted grace period” – additional extensions granted only in very special circumstances. Instructor must approve extensions.
Grading

****  35%  Assignments
**    15%  Lab Participation
**    17%  Midterm Exam
****  33%  Final Exam
Lab Sections

• Weekly 1 hour 50 minute labs led by a CA, starting next week, offered on Tuesdays, Wednesdays and Thursdays.

• Hands-on practice in pairs at computers with lecture material and course concepts.

• Graded on attendance + participation (verified by submitting work at the end)

• SCPD students complete lab work remotely (more info in SCPD Handout)

• Lab signups open Wednesday 4/3 at 5:55PM, and are first-come first-serve. A link will be posted on the course website.
Grading

**** 35% Assignments
** 15% Lab Participation
** 17% Midterm Exam
**** 33% Final Exam
Exams

• **Midterm exam** – Friday, May 10\(^{th}\), 12:30-2:20PM (during *full class period*)
• **Final exam** – Wednesday, June 12\(^{th}\), 12:15-3:15PM

• You **MUST** be able to take both exams at the scheduled time, except for university athletics or OAE accommodations.

• Both exams are closed-book, closed-notes, but you may bring in 1 double-sided page of notes. You will also be provided with a syntax reference sheet.

• SCPD students have 24hr window during which to take the exams

• Exams are administered electronically via BlueBook

The Stanford Honor Code is an undertaking of the students, individually and collectively:

- that they will not give or receive aid in examinations; that they will not give or receive unpermitted aid in class work, in the preparation of reports, or in any other work that is to be used by the instructor as the basis of grading;
- that they will do their share and take an active part in seeing to it that others as well as themselves uphold the spirit and letter of the Honor Code.

The faculty on its part manifests its confidence in the honor of its students by refraining from proctoring examinations and from taking unusual and unreasonable precautions to prevent the forms of dishonesty mentioned above. The faculty will also avoid, as far as practicable, academic procedures that create temptations to violate the Honor Code.

While the faculty alone has the right and obligation to set academic requirements, the students and faculty will work together to establish optimal conditions for honorable academic work.

see also: http://honorcode.stanford.edu/

It is your responsibility to ensure you have read and are familiar with the honor code guidelines posted on the main page of the CS107 course website. Please read them, and come talk to us if you have any questions or concerns.
Honor Code and CS107

• Please help us ensure academic integrity:
  • Indicate any assistance received on HW (books, friends, etc.).
  • Do not look at other people's solution code or answers
  • Do not give your solutions to others, or post them on the web or our Piazza forum.
  • Report any inappropriate activity you see performed by others.

• Assignments are checked regularly for similarity with help of software tools.

• If you realize that you have made a mistake, you may retract your submission to any assignment at any time, no questions asked.

• If you need help, please contact us and we will help you.
  • We do not want you to feel any pressure to violate the Honor Code in order to succeed in this course.
Plan For Today

• Introduction
• CS107 Course Policies
• Unix and the Command Line
• Getting Started With C
What is Unix?

• **Unix**: a set of standards and tools commonly used in software development.
  - **Macs** are built on top of Unix
  - **Linux** is built on top of Unix

• You can navigate a Unix system using the **command line** (“terminal”)

• Every Unix system works with the same tools and commands
What is the Command Line?

• The **command-line** is a text-based interface to navigate a computer, instead of a Graphical User Interface (GUI).
Why Use Unix / the Command Line?

• You can navigate almost any device using the same tools and commands:
  • Servers
  • Laptops and desktops
  • Embedded devices (Raspberry Pi, etc.)
  • Mobile Devices (Android, etc.)

• Used frequently by software engineers:
  • Web development: running servers and web tools on servers
  • Machine learning: processing data on servers, running algorithms
  • Systems: writing operating systems, networking code and embedded software
  • Mobile Development: running tools, managing libraries
  • And more...

• We are going to use Unix and the command line to write, debug, and run our programs.
Learning Unix and the Command Line

• Using Unix and the command line can be intimidating at first:
  • It looks really retro!
  • How do I know what to type?
• We are going to teach you how!
  • Live lecture demos
  • Lab activities
  • Assignments
  • The Resources page of the course website
Just like a GUI file explorer interface, a terminal interface:

- shows you a **specific place** on your computer at any given time.
- lets you go **into folders** and **out of folders**.
- lets you **create new** files and **edit** files.
- lets you **run programs**.
Demo: Using Unix and the Command Line
 Unix Commands Recap

• **cd** – change directories
• **ls** – list directory contents
• **mkdir** – make directory
• **emacs** – open text editor
• **rm** – remove file or folder
• **man** – view manual pages

See the Resources page of the course website for more commands, and a complete reference.
Plan For Today

• Introduction
• CS107 Course Policies
• Unix and the Command Line
• Getting Started With C
The C Language

C was created around 1970 to make writing Unix and Unix tools easier.

• Part of the C/C++/Java family of languages (C++ and Java were created later)

• Design principles:
  • Small, simple abstractions of hardware
  • Minimalist aesthetic
  • Prioritizes efficiency and minimalism over safety and high-level abstractions
C vs. C++ and Java

They all share:
• Syntax
• Basic data types
• Arithmetic, relational, and logical operators

C doesn’t have:
• More advanced features like operator overloading, default arguments, pass by reference, classes and objects, ADTs, etc.
• Extensive libraries (no graphics, networking, etc.) – this means not much to learn C!
• many compiler and runtime checks (this may cause security vulnerabilities!)
C is procedural: you write functions, rather than define new variable types with classes and call methods on objects. C is small, fast and efficient.

C++ is procedural, with objects: you write functions, and also define new variable types with classes, and call methods on objects.

Java is object-oriented: it is even more centered around defining new variable types with classes, and calling methods on objects.
Why C?

- Many tools (and even other languages, like Python!) are built with C.
- C is the language of choice for fast, highly efficient programs.
- C is popular for systems programming (operating systems, networking, etc.)
- C lets you work at a lower level to manipulate and understand the underlying system.
Programming Language Popularity

TIOBE Programming Community Index

Source: www.tiobe.com
Our First C Program

/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */
#include <stdio.h>  // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}
Our First C Program

/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */
#include <stdio.h> // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}

Program comments
You can write block or inline comments.
/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */

#include <stdio.h> // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}
Our First C Program

/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */

#include <stdio.h>  // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}

Main function – entry point for the program
Should always return an integer (0 = success)
/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */

#include <stdio.h> // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}

Main parameters – main takes two parameters, both relating to the command line arguments used to execute the program.

argc is the number of arguments in argv
argv is an array of arguments (char * is C string)
Our First C Program

/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */
#include <stdio.h>  // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}
int x = 42 + 7 * -5; // variables, types
double pi = 3.14159;
char c = 'Q'; /* two comment styles */

for (int i = 0; i < 10; i++) {
    if (i % 2 == 0) {
        x += i;
    }
}

while (x > 0 && c == 'Q' || b) {
    x = x / 2;
    if (x == 42) { return 0; }
}

fooBar(x, 17, c); // function call
Boolean Variables

To make Boolean variables, (e.g. `bool b = ____`), you must import `stdbool.h`:

```c
#include <stdio.h> // for printf
#include <stdbool.h> // for bool

int main(int argc, char *argv[]) {
    bool x = 5 > 2;
    if (x) {
        printf("Hello, world!\n");
    } else {
        printf("Howdy, world!\n");
    }
    return 0;
}
```
C treats a nonzero value as **true**, and a zero value as **false**:

```c
#include <stdio.h>

int main(int argc, char *argv[]) {
    int x = 5;
    if (x) {    // true
        printf("Hello, world!\n");
    } else {
        printf("Howdy, world!\n");
    }
    return 0;
}
```
printf(\textit{text}, \textit{arg1}, \textit{arg2}, \textit{arg3});

// Example
char *classPrefix = "CS";
int classNumber = 107;
printf("You are in %s%d", classPrefix, classNumber); // You are in CS107

printf makes it easy to print out the values of variables or expressions. If you include \textit{placeholders} in your printed text, printf will replace each placeholder \textit{in order} with the values of the parameters passed after the text.

\%s (string) \hspace{1cm} \%d (integer) \hspace{1cm} \%f (double)
Writing, Debugging and Compiling

We will use:

• the **emacs** text editor to write our C programs.
• the **gcc** and **make** tools to compile our C programs.
• the **gdb** debugger to debug our programs.
• the **valgrind** tools to debug memory errors, and measure the efficiency of our programs.
• **Emacs** is the editor we recommend and will use this quarter in lectures and labs to write and edit C programs.

• There are helpful **emacs** tips and guides on the Resources page of the course website.

• We will only support the **emacs** text editor this quarter for working on programs. In particular, we do not recommend using a local text editor such as Sublime Text due to risks of data loss.
Demo: Compiling And Running A C Program
Working On C Programs Recap

- **ssh** – remotely log in to Myth computers
- **Emacs** – text editor to write and edit C programs
  - Use the mouse to position cursor, scroll, and highlight text
  - Ctl-x Ctl-s to save, Ctl-x Ctl-c to quit
- **make** – compile program using provided Makefile
- **./myprogram** – run executable program (optionally with arguments)
- **make clean** – remove executables and other compiler files
- Lecture code is accessible at `/afs/ir/class/cs107/samples/lect[N]`
  - Hint: try looking up the `cp` command for how to make your own copy to edit/run!

See the Resources page of the course website for more commands, and a complete reference.
Assignment 0 (Introduction to Unix and C) is released on the course website, and is due in one week on Mon. 4/8 at 11:59PM PST.

There are 5 parts to the assignment, which is meant to get you comfortable using the command line, and editing/compiling/running C programs:

• Visit the Resources page to become familiar with different Unix commands
• Clone the assign0 starter project
• Answer several questions in readme.txt
• Compile a provided C program and modify it
• Submit the assignment
Recap

- CS107 is a programming class in C that teaches you about what goes on under the hood of programming languages and software.
- We’ll use Unix and command line tools to write, debug and run our programs.
- Please visit the course website, cs107.stanford.edu, where you can read the General Information Handout, information about the Honor Code in CS107, and more about CS107 course policies and logistics.

We’re looking forward to an awesome quarter!

Next time: How can a computer represent integer numbers?
