• Larger Applications
• What’s Next?
• Q&A
Plan For Today

• Recap: Where We’ve Been
  • Larger Applications
  • What’s Next?
• Q&A
We’ve covered a lot in just 10 weeks! Let’s take a look back.
Our CS107 Journey

- Bits and Bytes
- C Strings
- Arrays and Pointers
- Stack and Heap
- Generics
- Assembly
- Heap Allocators
Course Overview

1. **Bits and Bytes** - How can a computer represent integer numbers?
2. **Chars and C-Strings** - How can a computer represent and manipulate more complex data like text?
3. **Pointers, Stack and Heap** – How can we effectively manage all types of memory in our programs?
4. **Generics** - How can we use our knowledge of memory and data representation to write code that works with any data type?
5. **Assembly** - How does a computer interpret and execute C programs?
6. **Heap Allocators** - How do core memory-allocation operations like malloc and free work?
/*
 * hello.c
 * This program prints a welcome message
 * to the user.
 */

#include <stdio.h>  // for printf

int main(int argc, char *argv[]) {
    printf("Hello, world!\n");
    return 0;
}
The **command-line** is a text-based interface to navigate a computer, instead of a Graphical User Interface (GUI).
Key Question: How can a computer represent integer numbers?
Bits And Bytes

Why does this matter?

• Limitations of representation and arithmetic impact programs!
• We can also efficiently manipulate data using bits.

https://kotaku.com/why-gandhi-is-such-an-asshole-in-civilization-1653818245
Key Question: How can a computer represent and manipulate more complex data like text?

• Strings in C are arrays of characters ending with a null terminator!
• We can manipulate them using pointers and C library functions (many of which you could probably implement).
Why does this matter?

• Understanding this representation is key to efficient string manipulation.
• This is how strings are represented in both low- and high-level languages!
  • C++: https://www.quora.com/How-does-C++-implement-a-string
  • Python: https://www.laurentluce.com/posts/python-string-objects-implementation/
**Key Question:** How can we effectively manage all types of memory in our programs?

- Arrays let us store ordered lists of information.
- Pointers let us pass addresses of data instead of the data itself.
- We can use the stack, which cleans up memory for us, or the heap, which we must manually manage.

![Diagram](attachment:memory-diagram.png)
Stack And Heap

Why does this matter?

• The stack and heap allow for two ways to store data in our programs, each with their own tradeoffs, and it’s crucial to understand the nuances of managing memory in any program you write!

• Pointers let us pass around references to data efficiently
Generics

Key Question: How can we use our knowledge of memory and data representation to write code that works with any data type?

• We can use `void *` to circumvent the type system, `memcpy`, etc. to copy generic data, and function pointers to pass logic around.

Why does this matter?

• Working with any data type lets us write more generic, reusable code.
• Using generics helps us better understand the type system in C and other languages, and where it can help and hinder our program.
Assembly Language

Key Question: *How does a computer interpret and execute C programs?*

- GCC compiles our code into *machine code instructions* executable by our processor.
- Our processor uses registers and instructions like **mov** to manipulate data.
Assembly Language

Why does this matter?

• We write C code because it is higher level and transferrable across machines. But it is not the representation executed by the computer!

• Understanding how programs are compiled and executed, as well as computer architecture, is key to writing performant programs (e.g. fewer lines of code is not necessarily better).

• We can reverse engineer and exploit programs at the assembly level!
Heap Allocators

**Key Question:** *How do core memory-allocation operations like `malloc` and `free` work?*

- A *heap allocator* manages a block of memory for the heap and completes requests to use or give up memory space.
- We can manage the data in a heap allocator using headers, pointers to free blocks, or other designs.

Why does this matter?

- Designing a heap allocator requires making many design decisions to optimize it as much as possible. There is no perfect design!
- All languages have a “heap” but manipulate it in different ways.
Key Question: How do we act responsibly in maintaining security, protecting privacy, and ensuring warranted trust in the systems we build and maintain?

Why does this matter?

• Responsible programming involves documentation -- including informative error messages! -- that allows others to evaluate the reliability of your code.

• Responsible system and program design also requires choosing a trust model and considering data privacy. This might also require deciding to whom to be partial.
The goals for CS107 are for students to gain **mastery** of
- writing C programs with complex use of memory and pointers
- an accurate model of the address space and compile/runtime behavior of C programs
to achieve **competence** in
- translating C to/from assembly
- writing programs that respect the limitations of computer arithmetic
- identifying bottlenecks and improving runtime performance
- working effectively in a Unix development environment
- using ethical frameworks and case studies to inform decision-making
and have **exposure** to
- a working understanding of the basics of computer architecture
Plan For Today

- What’s Next?
- Q&A
Plan For Today

- **Recap**: Where We’ve Been
- **Larger Applications**
  - CS107 Tools and Techniques
  - CS107 Concepts
- **What’s Next?**
- **Q&A**
Plan For Today

• Recap: Where We’ve Been
• Larger Applications
  • CS107 Tools and Techniques
  • CS107 Concepts
• What’s Next?
• Q&A
Tools and Techniques

- Unix and the command line
- Coding Style
- Debugging (GDB)
- Testing (Sanity Check)
- Memory Checking (Valgrind)
- Profiling (Callgrind)
Unix and command line tools are extremely popular tools outside of CS107 for:

• Running programs (web servers, python programs, remote programs…)
• Accessing remote servers (Amazon Web Services, Microsoft Azure, Heroku…)
• Programming embedded devices (Raspberry Pi, etc.)

Our goal for CS107 was to help you become proficient in navigating Unix
Coding Style

• Writing clean, readable code is crucial for any computer science project
• Unfortunately, a fair amount of existing code is poorly-designed/documented

Our goal for CS107 was to help you write with good coding style, and read/understand/comment provided code.
Debugging (GDB)

• Debugging is a crucial skill for any computer scientist
• Our goal for CS107 was to help you become a better debugger
  • narrow in on bugs
  • diagnose the issue
  • implement a fix
• Practically every project you work on will have debugging facilities
  • Python: “PDB”
  • IDEs: built-in debuggers (e.g. QT Creator, Eclipse)
  • Web development: in-browser debugger
Testing is a crucial skill for any computer scientist

Our goal for CS107 was to help you become a better tester

- Writing targeted tests to validate correctness
- Use tests to prevent regressions
- Use tests to develop incrementally
Memory Checking and Profiling

• Memory checking and profiling are crucial for any computer scientist to analyze program performance and increase efficiency.

• Many projects you work on will have profiling and memory analysis facilities:
  • Mobile development: integrated tools (XCode Instruments, Android Profiler, etc.)
  • Web development: in-browser tools
You’ll see manifestations of these tools throughout projects you work on. We hope you can use your CS107 knowledge to take advantage of them!
Plan For Today

• Recap: Where We’ve Been
• Larger Applications
  • CS107 Tools and Techniques
  • CS107 Concepts
• What’s Next?
• Q&A
Concepts

• C Language
• Bit-Level Representations
• Arrays and Pointers
• Memory Management
• Generics
• Assembly
How can we write programs that execute multiple tasks simultaneously? (take CS111!)
• Threads of execution
• “Locks” to prevent simultaneous access

How is a compiler implemented? (take CS143!) [Demo]
• Lexical analysis
• Parsing
• Semantic Analysis
• Code Generation

How can applications communicate over a network? (take CS144!)
• How can we weigh different tradeoffs of network architecture design?
• How can we effectively transmit bits across a network?
How is an operating system implemented? (take CS111/CS140/CS112/CS212!)

• Threads
• User Programs
• Virtual Memory
• Filesystem
Can we speed up machine learning training with reduced precision computation?

How can we implement performant machine learning libraries?

- Popular tools such as TensorFlow and PyTorch are implemented using C!
- https://pytorch.org/blog/a-tour-of-pytorch-internals-1/
- https://www.tensorflow.org/guide/extend/architecture
Web Development

How can we efficiently translate Javascript code to machine code?

• The Chrome V8 JavaScript engine converts Javascript into machine code for computers to execute: https://medium.freecodecamp.org/understanding-the-core-of-nodejs-the-powerful-chrome-v8-engine-79e7eb8af964

• The popular Node.js web server tool is built on Chrome V8

How can we compile programs into an efficient binary instruction format that runs in a web browser?

• WebAssembly is an emerging standard instruction format that runs in browsers: https://webassembly.org

• [DEMO] You can compile C/C++/other languages into WebAssembly for web execution
How can programming languages and runtimes efficiently manage memory?
• Manual memory management (C/C++)
• Reference Counting (Swift)
• Garbage Collection (Java)

How can we design programming languages to reduce the potential for programmer error? (take CS242!)
• Haskell/Swift “Optionals”

How can we design portable programming languages?
How can compilers output efficient machine code instructions for programs? (take CS143!)

• Languages can be represented as regular expressions and context-free grammars

• We can model programs as control-flow graphs for additional optimization
How can we find / fix vulnerabilities at various levels in our programs? (take CS155!)

- Understand machine-level representation and data manipulation
- Understand how a computer executes programs
- macOS High Sierra Root Login Bug: [https://objective-see.com/blog/blog_0x24.html](https://objective-see.com/blog/blog_0x24.html)

How can we ensure that our systems and networks are secure? (take CS155!)
How can we design internet services that are worthy of trust? (take CS152!)
Ethics, Privacy, Partiality and Trust

Why is privacy important? What technical and policy standards should we strive for in protecting privacy? (take CS 182!)

How can we recognize ethically important decisions as they arise? What policies ought we to adopt to address these issues? (take CS 181!)
• Unfortunately, we couldn’t cover floating point numbers this quarter
  • Lecture video from past quarter [here](#)!

• An example of tradeoffs in design decisions.

• Importance of thinking through priorities and pros/cons when designing systems.
Approximation and rounding is inevitable.

Single operations are commutative, but sequence is not associative.

\[(a + b) \text{ equals } (b + a)\]

But \((a + b) + c\) may not equal \(a + (b + c)\)

Equality comparison operations are often unwise.
Approximation and rounding is inevitable.

Single operations are commutative, but sequence is not associative.

\[(a + b) \text{ equals } (b + a)\]

But \((a + b) + c\) may not equal \(a + (b + c)\)

Equality comparison operations are often unwise.
Nick’s Official Guide To Making Money

It’s easy!
Demo: Float Arithmetic

Try it yourself:
./bank 100 1      # deposit
./bank 100 -1     # withdraw
./bank 100000000 -1 # make bank
./bank 16777216 1  # lose bank
Plan For Today

• **Recap:** Where We’ve Been
• Larger Applications
• **What’s Next?**
• Q&A
After CS107, you are prepared to take a variety of classes in various areas. What are some options?
Where Are We?

- CS 106B/X: Programming Abstractions
- CS 107/E: Computer Organization and Systems
- CS 111: Operating Systems Principles
- CS 103: Mathematical Foundations of Computing
- CS 109: Intro to Probability for Computer Scientists
- CS 161: Design and Analysis of Algorithms

We are here.
• How can programs perform multiple tasks concurrently and share resources between those tasks?
• How does every program think it has access to all memory addresses if it needs them?
• How can we implement a filesystem to store persistent data?
Other Courses

- **CS112**: Operating Systems Project
- **CS140/CS212**: Operating Systems
- **CS143**: Compilers
- **CS144**: Networking
- **CS145**: Databases
- **CS152**: Trust and Safety Engineering
- **CS155**: Computer and Network Security
- **CS166**: Data Structures
- **CS181**: Computers, Ethics, and Public Policy
- **CS182**: Ethics, Public Policy, and Technological Change
- **CS221**: Artificial Intelligence
- **CS246**: Mining Massive Datasets
- **EE108**: Digital Systems Design
- **EE180**: Digital Systems Architecture
