CS107, Lecture 23 Managing The Heap, Take II

Reading: B&O 9.9 and 9.11

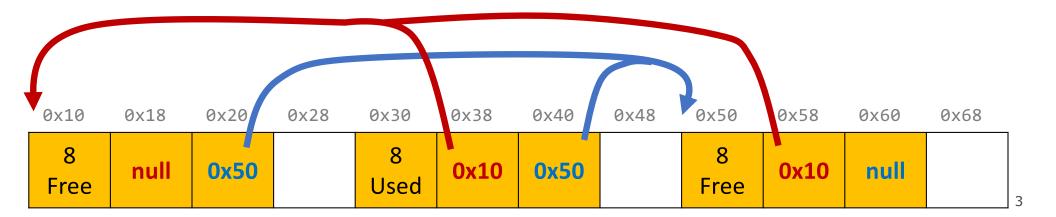

Ed Discussion: https://edstem.org/us/courses/46162/discussion/3867604

- It would be nice if we could jump *just between free blocks*, rather than all blocks, to find a block to reuse.
- Idea: let's modify each header to add a pointer to the previous free block and a pointer to the next free block.

4

- It would be nice if we could jump *just between free blocks*, rather than all blocks, to find a block to reuse.
- **Idea:** let's modify each header to add a pointer to the previous free block and a pointer to the next free block. *This is inefficient / complicated.*
- Where can we put these pointers to the next/previous free block?
- Idea: In a separate data structure?

- **Idea:** let's modify each header to add a pointer to the previous free block and a pointer to the next free block. *This is inefficient / complicated.*
- Where can we put these pointers to the next/previous free block?
- **Idea:** In a separate data structure? *More difficult to access in a separate place prefer storing near blocks on the heap itself.*

- **Key Insight:** the payloads of the free blocks aren't being used, because they're free.
- **Idea:** since we only need to store these pointers for free blocks, let's store them in the <u>first 16 bytes of each free block's payload!</u>

0x10	0x18	0x20	0x28	0x30	0x38	0x40	0x48	0x50	0x58	0x60	0x68

- **Key Insight:** the payloads of the free blocks aren't being used, because they're free.
- **Idea:** since we only need to store these pointers for free blocks, let's store them in the <u>first 16 bytes of each free block's payload!</u>
- This means each payload must be big enough to store 2 pointers (16 bytes). So, we must require that for every free block and every allocated one as well.

Explicit Free List Allocator

- This design builds on the implicit allocator, but also stores pointers to the next and previous free block inside each free block's payload.
- When we allocate a block, we look through just the free blocks using our linked list to find a free one, and we update its header and the linked list to reflect its allocated size and that it is now allocated.
- When we free a block, we update its header to reflect it is now free and update the linked list.

This **explicit** list of free blocks increases request throughput, with some costs (design and internal fragmentation)

Explicit Free List: List Design

How do you want to organize your explicit free list? (compare utilization/throughput)

- A. Address-order (each block's address is less than successor block's address)
- B. Last-in first-out (LIFO)/like a stack, where newly freed blocks are at the beginning of the list
- C. Other (e.g., by size, etc.)

Up to you!

Better memory utilization, Linear-time free

Constant free (push recent block onto stack)

(more at end of lecture)

Explicit free list design

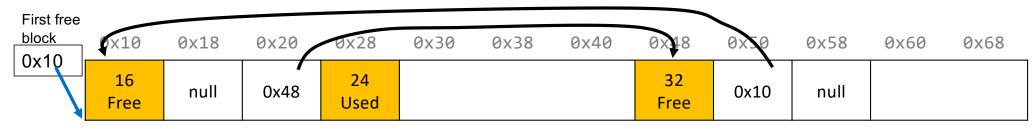

Up to you!

First free

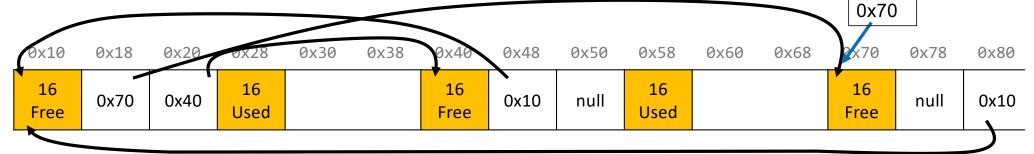

block

How do you want to organize your explicit free list?(utilization/throughput)

A. Address-order Better memory util, linear free

B. Last-in first-out (LIFO) Constant free (push recent block onto stack)

C. Other (e.g., by size, etc.) (see textbook)

Implicit vs. Explicit: So Far

Implicit Free List

• 8B header for size + alloc/free status

- Allocation requests are worst-case linear in total number of blocks
- Implicitly address-order

Explicit Free List

- 8B header for size + alloc/free status
- Free block payloads store prev/next free block pointers
- Allocation requests are worst-case linear in number of free blocks
- Can choose block ordering

Revisiting Our Goals

Can we do better?

- 1. Can we avoid searching all blocks for free blocks to reuse? Yes! We can use a doubly-linked list.
- 2. Can we merge adjacent free blocks to keep large spaces available?
- 3. Can we avoid always copying/moving data during realloc?

Revisiting Our Goals

```

We have enough memory space, but it is fragmented into free blocks sized from earlier requests!

We'd like to be able to merge adjacent free blocks back together. How can we do this?

The process of combining adjacent free blocks is called *coalescing*.

For your explicit heap allocator, you should coalesce, if possible, when a block is freed. You only need to coalesce the most immediate right neighbor.

Revisiting Our Goals

Can we do better?

- 1. Can we avoid searching all blocks for free blocks to reuse? Yes! We can use a doubly-linked list.
- 2. Can we merge adjacent free blocks to keep large spaces available? Yes! We can try to right-coalesce when calling free.
- 3. Can we avoid always copying/moving data during realloc?

Revisiting Our Goals

Can we do better?

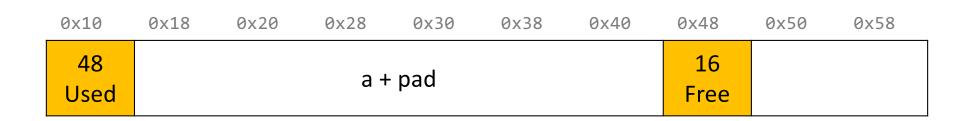

- 1. Can we avoid searching all blocks for free blocks to reuse? Yes! We can use a doubly-linked list.
- 2. Can we merge adjacent free blocks to keep large spaces available? Yes! We can try to right-coalesce when calling free.
- 3. Can we avoid always copying/moving data during realloc?

Realloc

- For the implicit allocator, we didn't worry much about realloc. We always moved data when they requested a different amount of space.
 - Note: realloc can grow or shrink the data size.
- But sometimes we may be able to keep the data in the same place. How?
 - Case 1: size is growing, but we added padding to the block and can use that
 - Case 2: size is shrinking, so we can use the existing block
 - Case 3: size is growing, and current block isn't big enough, but adjacent blocks are free.

```
void *a = malloc(42);
...
void *b = realloc(a, 48);
```

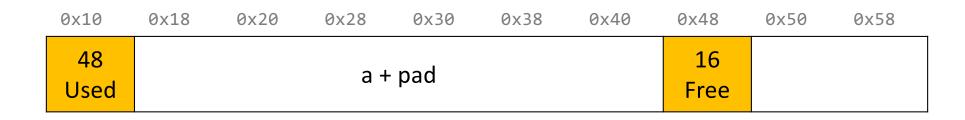

a's earlier request was too small, so we added padding. Now they are requesting a larger size we can satisfy with that padding! So realloc can return the same address.

```
void *a = malloc(42);
...
void *b = realloc(a, 16);
```

If a realloc is requesting to shrink, we can still use the same starting address.

If we can, we should try to recycle the now-freed memory into another freed block.

```
void *a = malloc(42);
...
void *b = realloc(a, 16);
```

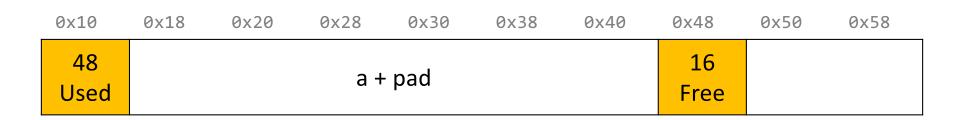

If a realloc is requesting to shrink, we can still use the same starting address.

If we can, we should try to recycle the now-freed memory into another freed block.

0x1	LØ	0x18	0x20	0x28	0x30	0x38	0x40	0x48	0x50	0x58
	.6 sed		a	24 Free		а		16 Free		

```
void *a = malloc(42);
...
void *b = realloc(a, 72);
```

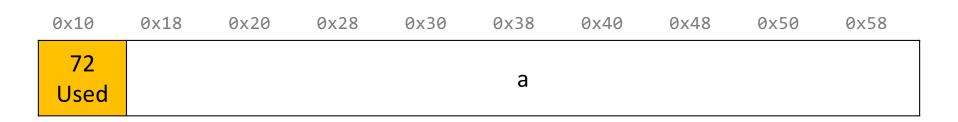

Even with the padding, we don't have enough space to satisfy the larger size. But we have an adjacent neighbor that is free – let's team up!

```
void *a = malloc(42);
...
void *b = realloc(a, 72);
```

Even with the padding, we don't have enough space to satisfy the larger size. But we have an adjacent neighbor that is free – let's team up!

Now we can still return the same address.

```
void *a = malloc(8);
...
void *b = realloc(a, 72);
```

For your project, you should combine with your *right* neighbors as much as possible until we get enough space, or until we know we cannot get enough space.
