Climate Sensitivity

Review

The Normal Distribution

- X is a **Normal Random Variable**: $X \sim N(\mu, \sigma^2)$

- Probability Density Function (PDF):

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma^2}$$

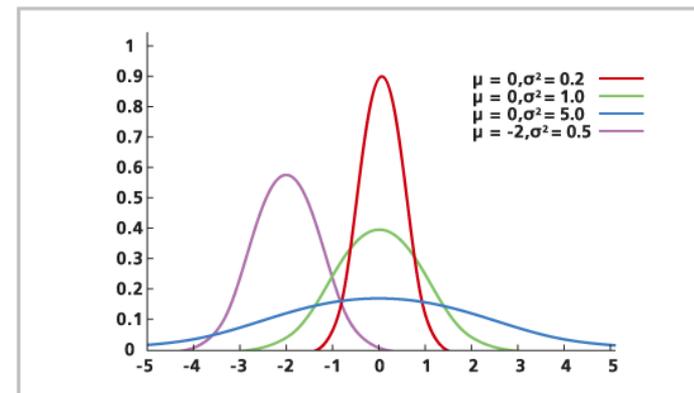

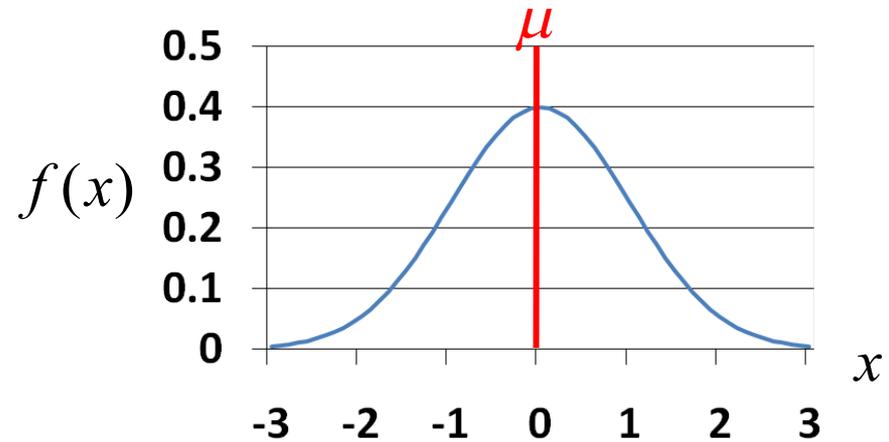

where $-\infty < x < \infty$

- $E[X] = \mu$

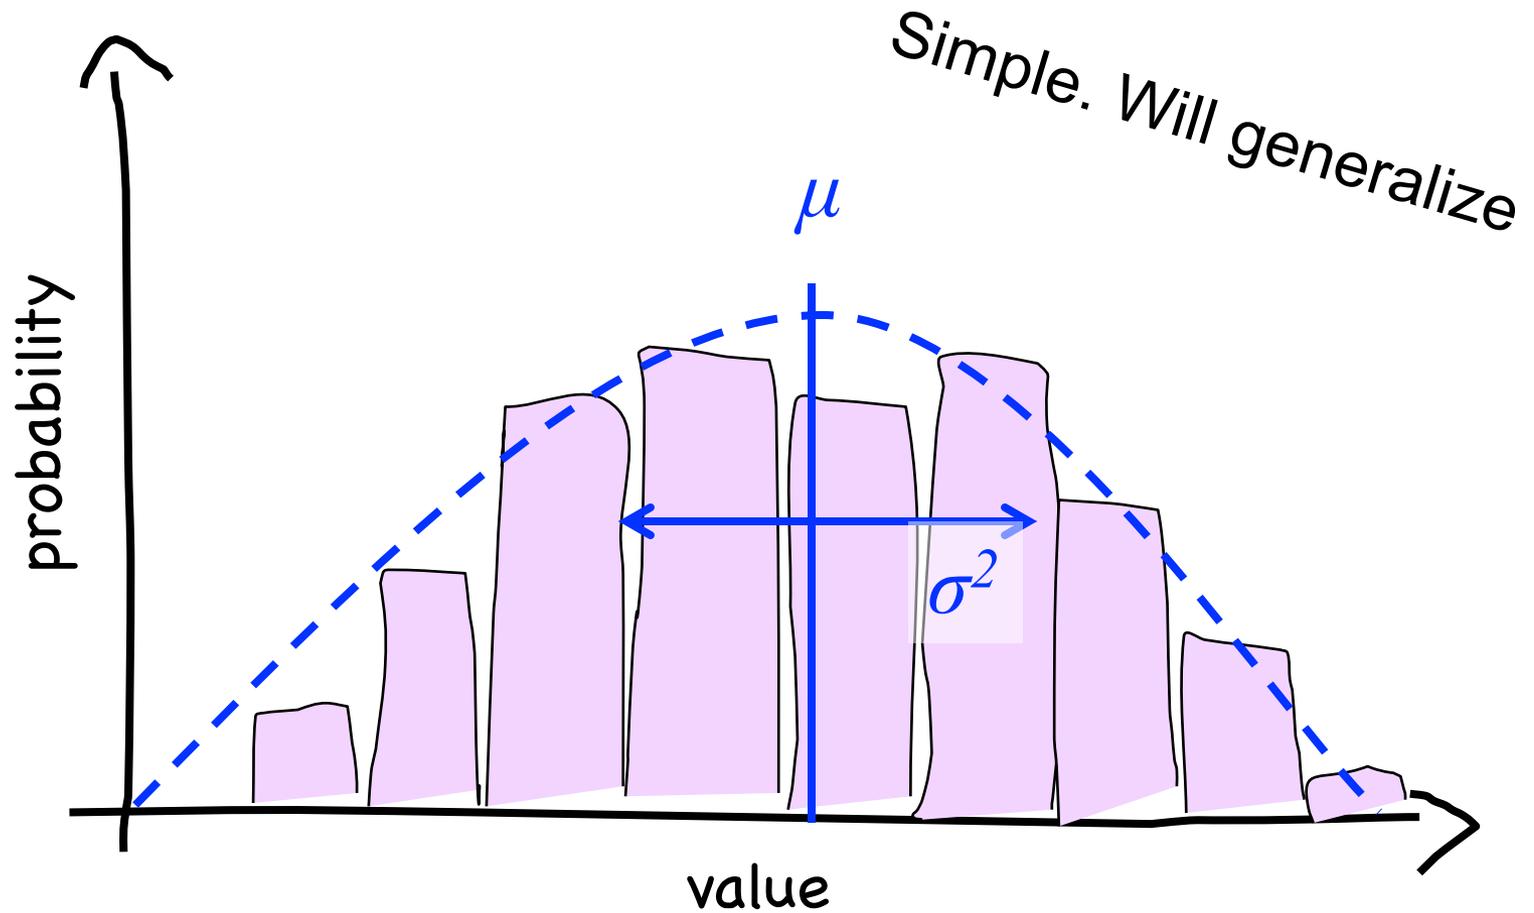

- $Var(X) = \sigma^2$

- Also called “Gaussian”

- Note: $f(x)$ is symmetric about μ

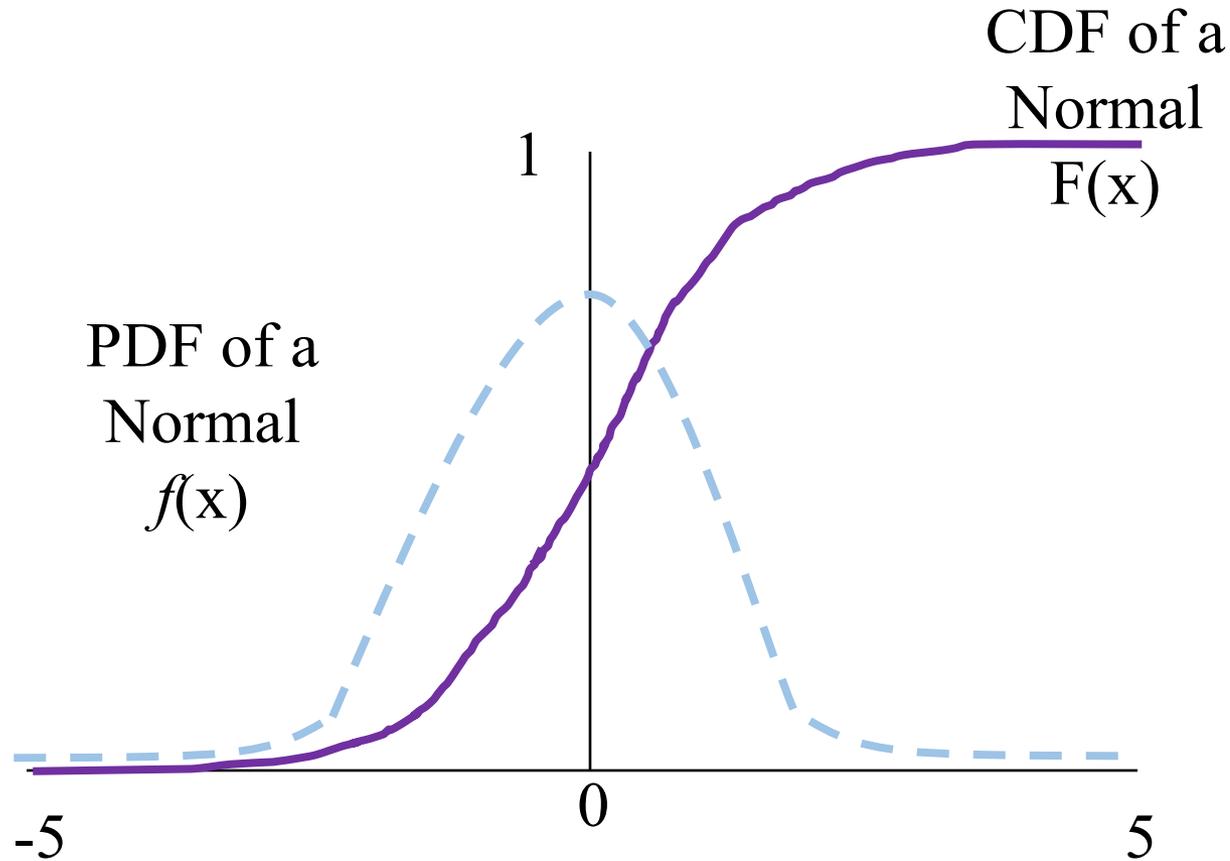

Simplicity is Humble

* A Gaussian maximizes entropy for a given mean and variance

Density vs Cumulative

$f(x)$ = derivative of probability

$F(x) = P(X < x)$

Probability Density Function

$$\mathcal{N}(\mu, \sigma^2)$$

$$f(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

probability density at x

“exponential”

the distance to the mean

a constant

sigma shows up twice

The diagram shows the normal distribution PDF formula with several purple annotations. An arrow points from the text 'probability density at x' to the function symbol f(x). Another arrow points from 'a constant' to the denominator sigma*sqrt(2*pi). A third arrow points from 'sigma shows up twice' to the sigma^2 term in the exponent's denominator. Two arrows point from 'exponential' and 'the distance to the mean' to the exponent -(x-mu)^2.

Cumulative Density Function

$$\mathcal{N}(\mu, \sigma^2)$$

CDF of Standard Normal: A function that has been solved for numerically

$$F(x) = \Phi\left(\frac{x - \mu}{\sigma}\right)$$

The cumulative density function (CDF) of any normal

Table of $\Phi(z)$ values in textbook, p. 201 and handout

Great questions!

68% rule only for Gaussians?

68% Rule?

What is the probability that a normal variable $X \sim N(\mu, \sigma^2)$ has a value within one standard deviation of its mean?

$$\begin{aligned}P(\mu - \sigma < X < \mu + \sigma) &= P\left(\frac{\mu - \sigma - \mu}{\sigma} < \frac{X - \mu}{\sigma} < \frac{\mu + \sigma - \mu}{\sigma}\right) \\&= P(-1 < Z < 1) \\&= \Phi(1) - \Phi(-1) \\&= \Phi(1) - [1 - \Phi(1)] \\&= 2\Phi(1) - 1 \\&= 2[0.8413] - 1 = 0.683\end{aligned}$$

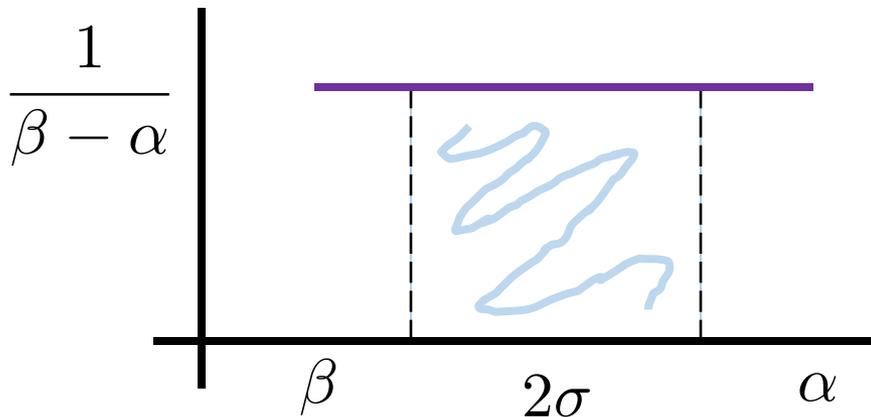

Only applies to normal

68% Rule?

Counter example: Uniform $X \sim Uni(\alpha, \beta)$

$$Var(X) = \frac{(\beta - \alpha)^2}{12}$$

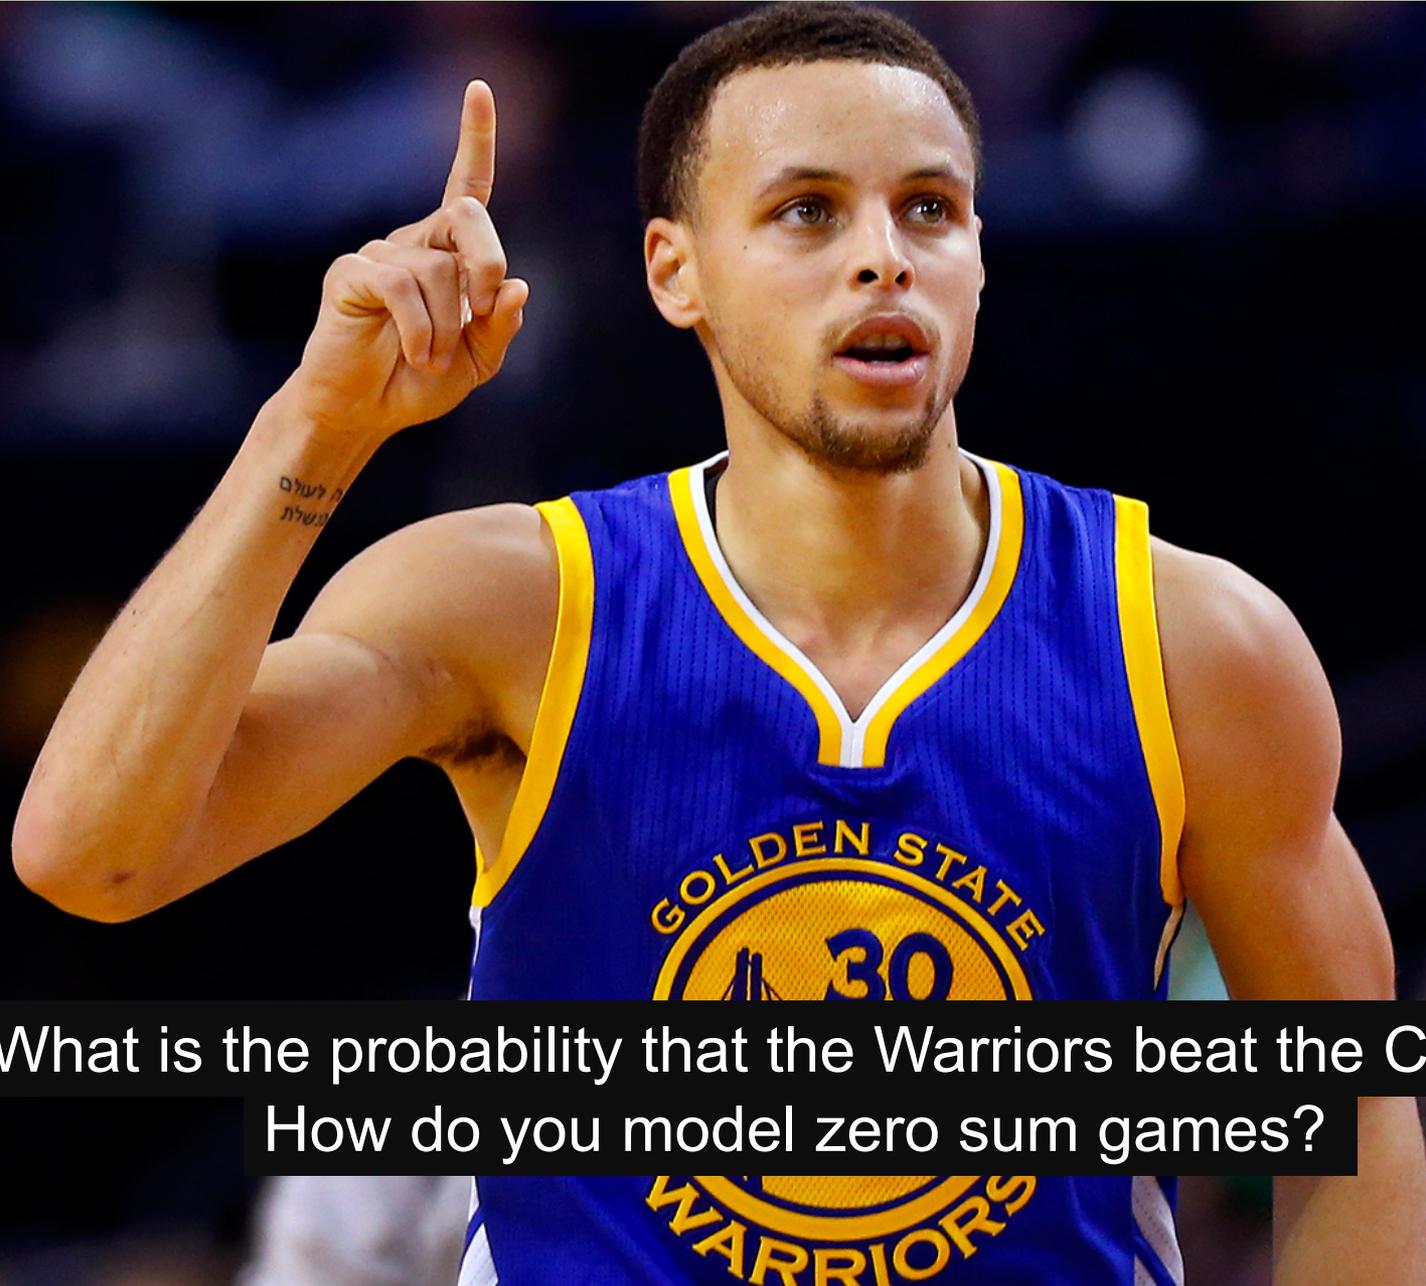

$$\begin{aligned}\sigma &= \sqrt{Var(X)} \\ &= \frac{\beta - \alpha}{\sqrt{12}}\end{aligned}$$

$$\begin{aligned}P(\mu - \sigma < X < \mu + \sigma) \\ &= \frac{1}{\beta - \alpha} \left[\frac{2(\beta - \alpha)}{\sqrt{12}} \right] \\ &= \frac{2}{\sqrt{12}} \\ &= 0.58\end{aligned}$$

End Review

ELO Ratings

What is the probability that the Warriors beat the Cavs?
How do you model zero sum games?

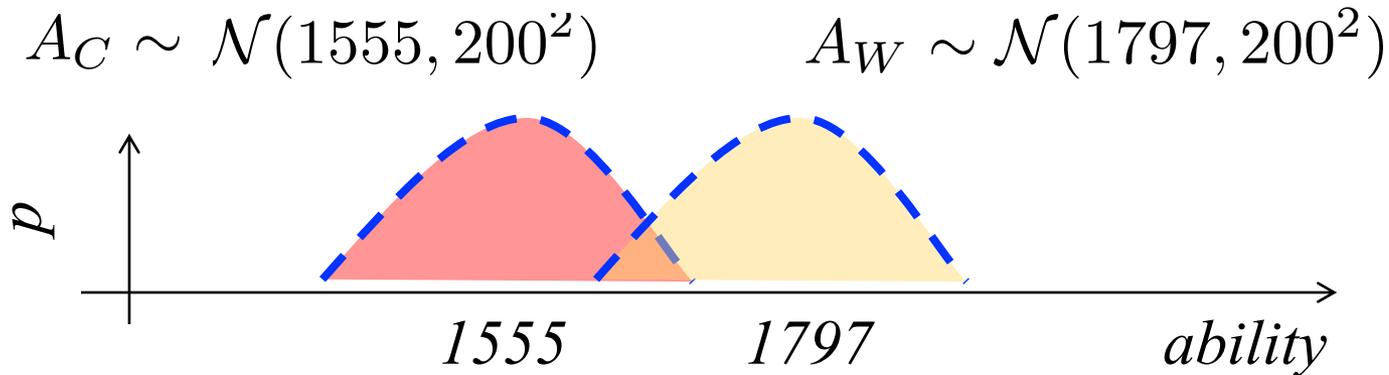

ELO Ratings

How it works:

- Each team has an “ELO” score S , calculated based on their past performance.
- Each game, the team has ability $A \sim \mathcal{N}(S, 200^2)$
- The team with the higher sampled ability wins.

Arpad Elo

$$P(\text{Warriors win}) = P(A_W > A_C)$$

ELO Ratings

```
from random import *
NTRIALS = 10000
WARRIORS_ELO = 1797
CAVS_ELO = 1555
STD = 200

nSuccess = 0
for i in range(NTRIALS):
    w = gauss(WARRIORS_ELO, STD)
    b = gauss(CAVS_ELO, STD)
    if w > b:
        nSuccess += 1

print float(nSuccess) / NTRIALS
```

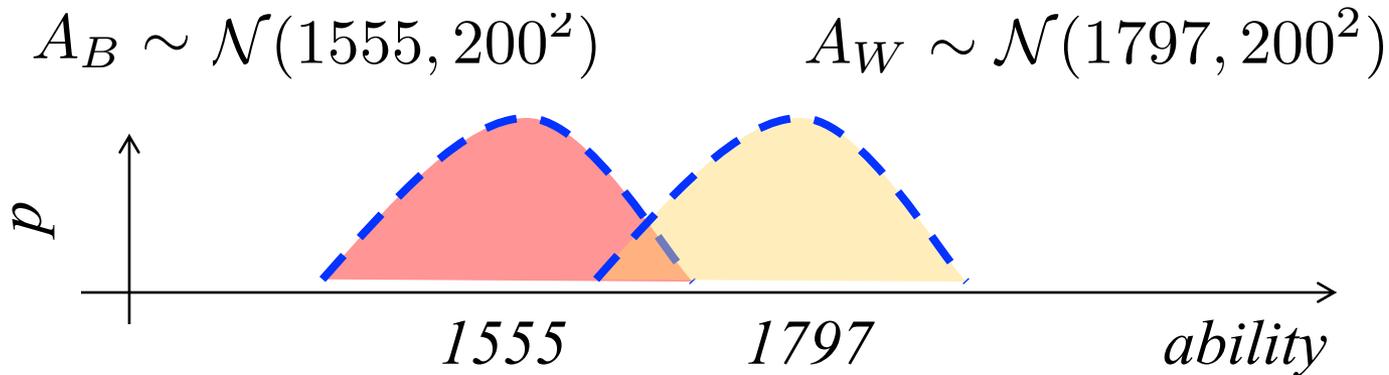

ELO Ratings

How it works:

- Each team has an “ELO” score S , calculated based on their past performance.
- Each game, the team has ability $A \sim N(S, 200^2)$
- The team with the higher sampled ability wins.

Arpad Elo

$$P(\text{Warriors win}) = P(A_W > A_B)$$

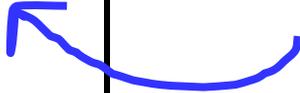

$$\approx 0.87$$

← Calculated via sampling

How does python sample from a
Gaussian?

```
from random import *  
  
for i in range(10):  
    mean = 5  
    std = 1  
    sample = gauss(mean, std)  
    print sample
```

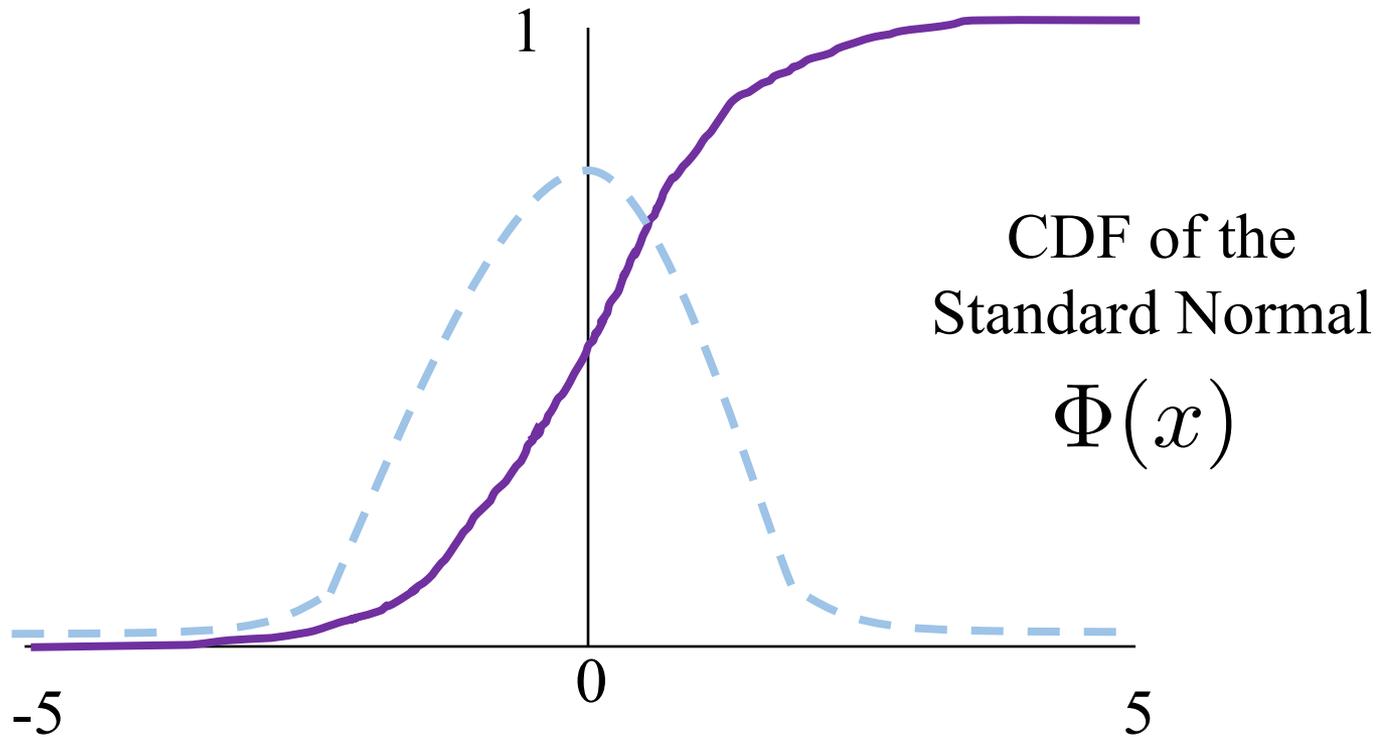

How
does this
work?

```
3.79317794179  
5.19104589315  
4.209360629  
5.39633891584  
7.10044176511  
6.72655475942  
5.51485158841  
4.94570606131  
6.14724644482  
4.73774184354
```

How Does a Computer Sample Normal?

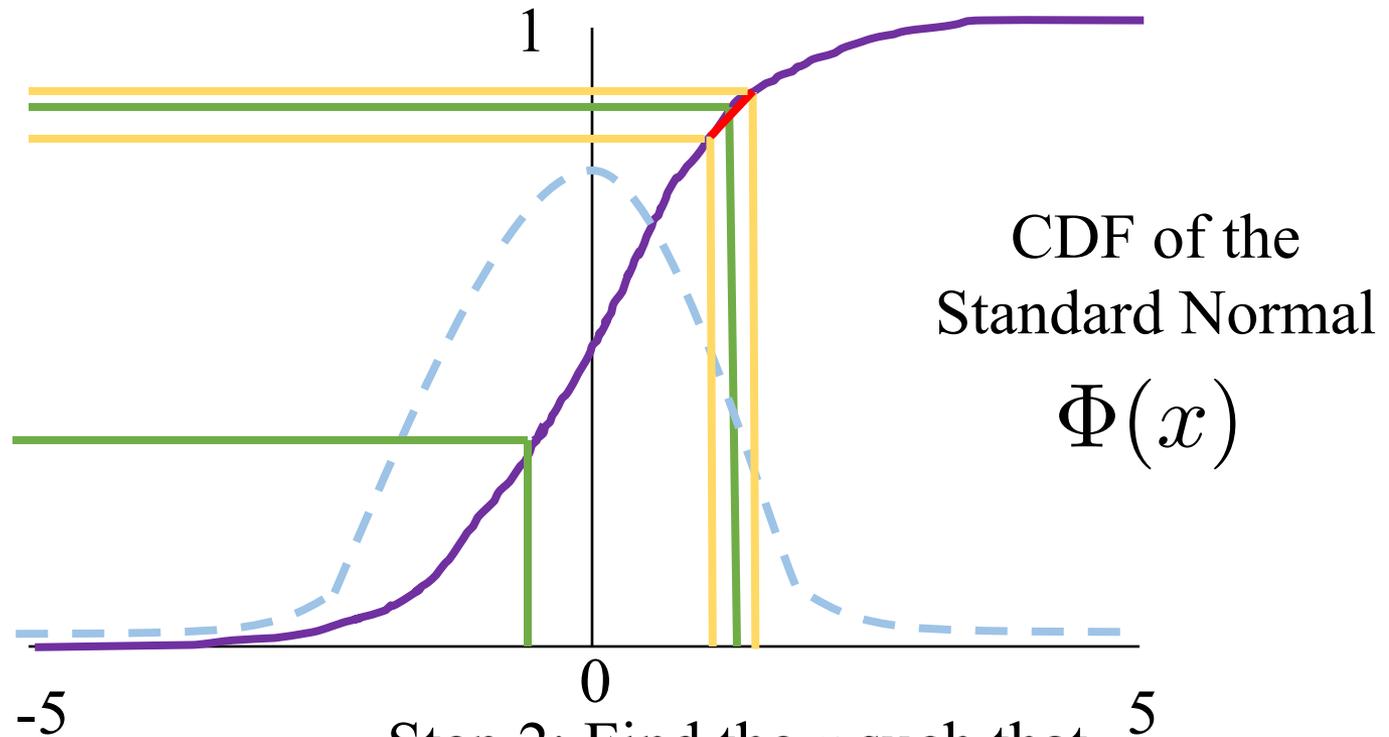

Inverse Transform Sampling

How Does a Computer Sample Normal?

Inverse Transform Sampling

Step 1: pick a uniform number y
between 0,1

Step 2: Find the x such that

$$\Phi(x) = y$$

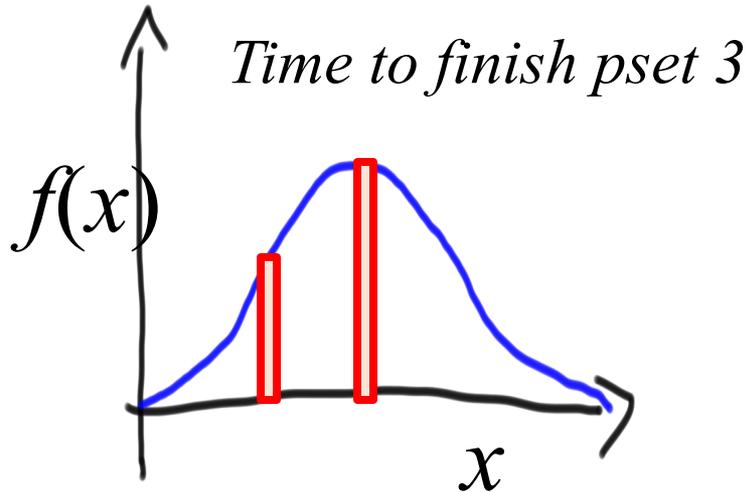

$$x = \Phi^{-1}(y)$$

Further reading: Box–Muller transform

Continuous RV Relative Probability

$X =$ time to finish pset 3

$X \sim N(10, 2)$

How much more likely
are you to complete in
10 hours than in 5?

$$\begin{aligned}\frac{P(X = 10)}{P(X = 5)} &= \frac{\varepsilon f(X = 10)}{\varepsilon f(X = 5)} \\ &= \frac{f(X = 10)}{f(X = 5)} \\ &= \frac{\frac{1}{\sqrt{2\sigma^2\pi}} e^{-\frac{(10-\mu)^2}{2\sigma^2}}}{\frac{1}{\sqrt{2\sigma^2\pi}} e^{-\frac{(5-\mu)^2}{2\sigma^2}}} \\ &= \frac{\frac{1}{\sqrt{4\pi}} e^{-\frac{(10-10)^2}{4}}}{\frac{1}{\sqrt{4\pi}} e^{-\frac{(5-10)^2}{4}}} \\ &= \frac{e^0}{e^{-\frac{25}{4}}} = 518\end{aligned}$$

Imagine you are sitting a test...

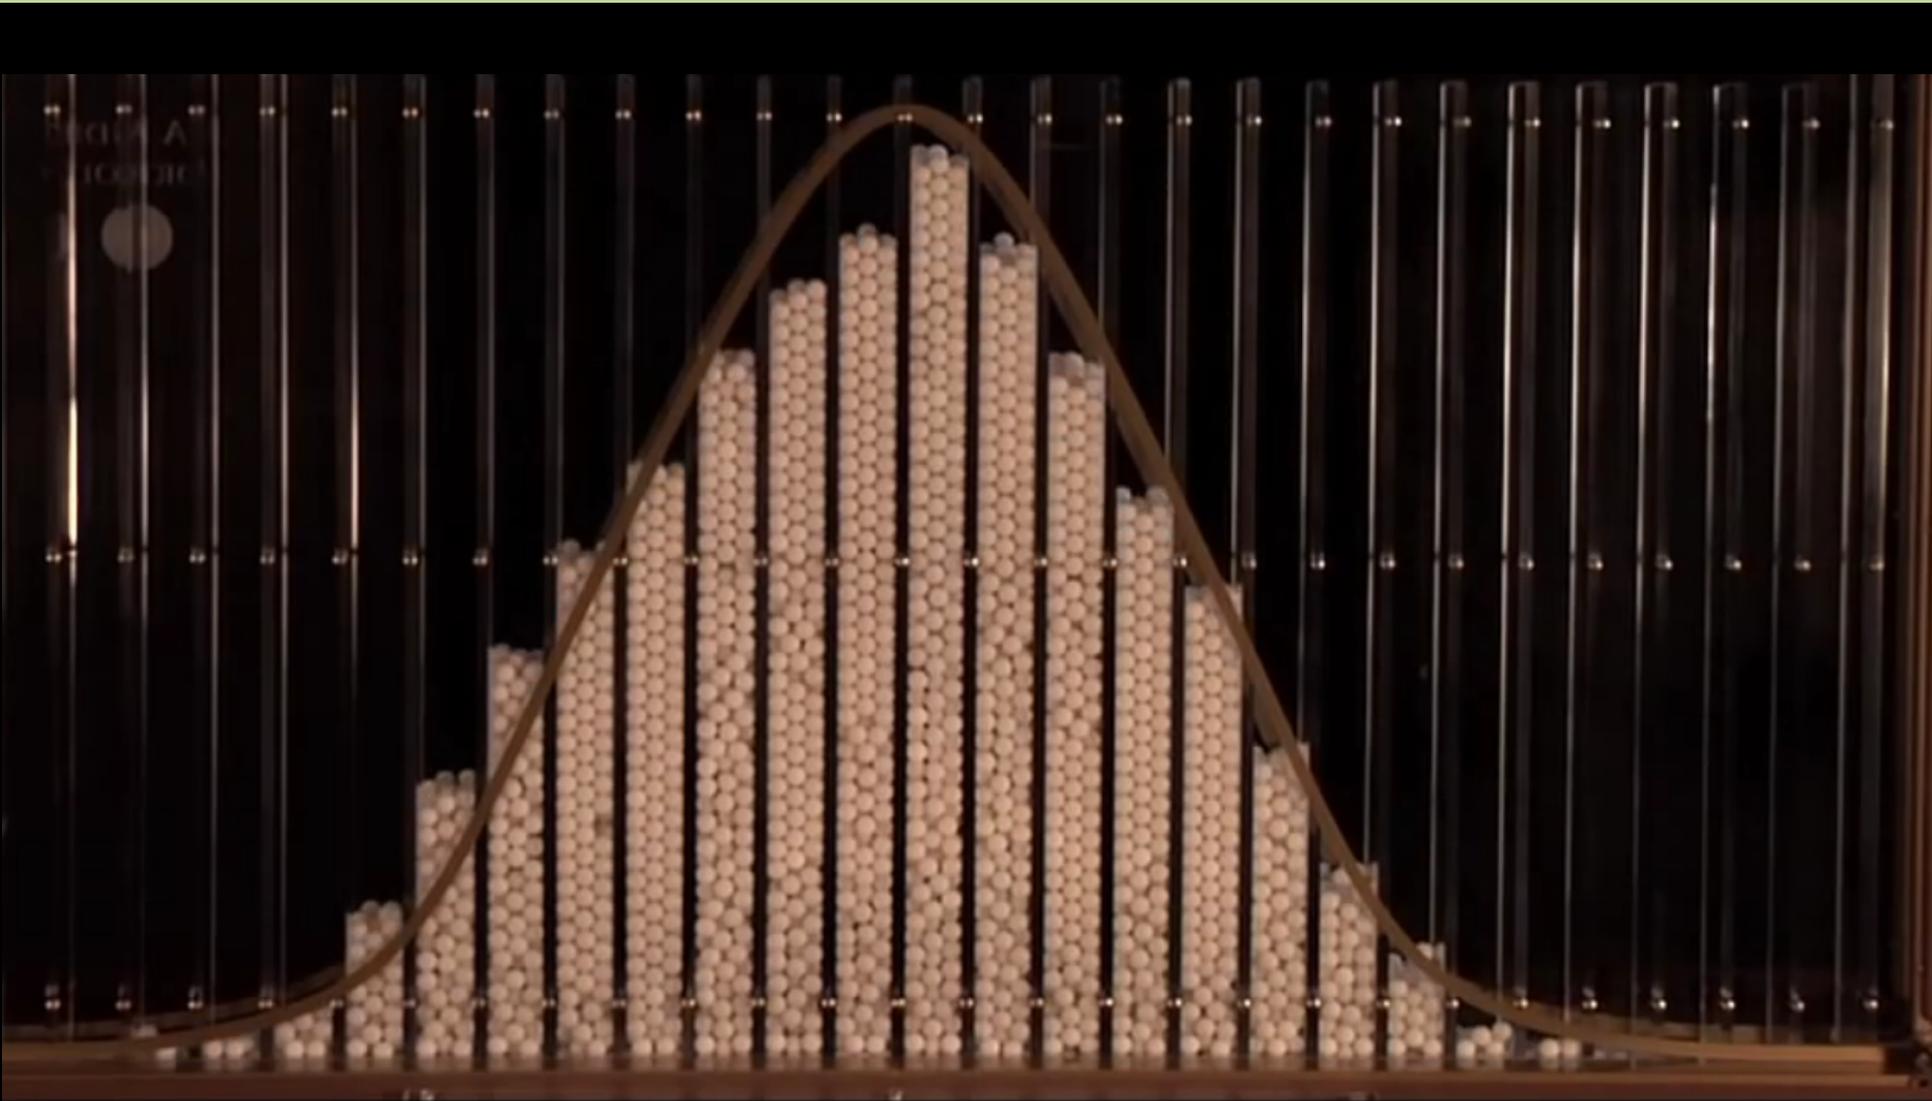

Website Testing

- 100 people are given a new website design
 - $X = \#$ people whose time on site increases
 - CEO will endorse new design if $X \geq 65$ What is $P(\text{CEO endorses change} | \text{it has no effect})$?
 - $X \sim \text{Bin}(100, 0.5)$. Want to calculate $P(X \geq 65)$
 - Give an exact answer...

$$P(X \geq 65) = \sum_{i=65}^{100} \binom{100}{i} (0.5)^i (1 - 0.5)^{100-i}$$

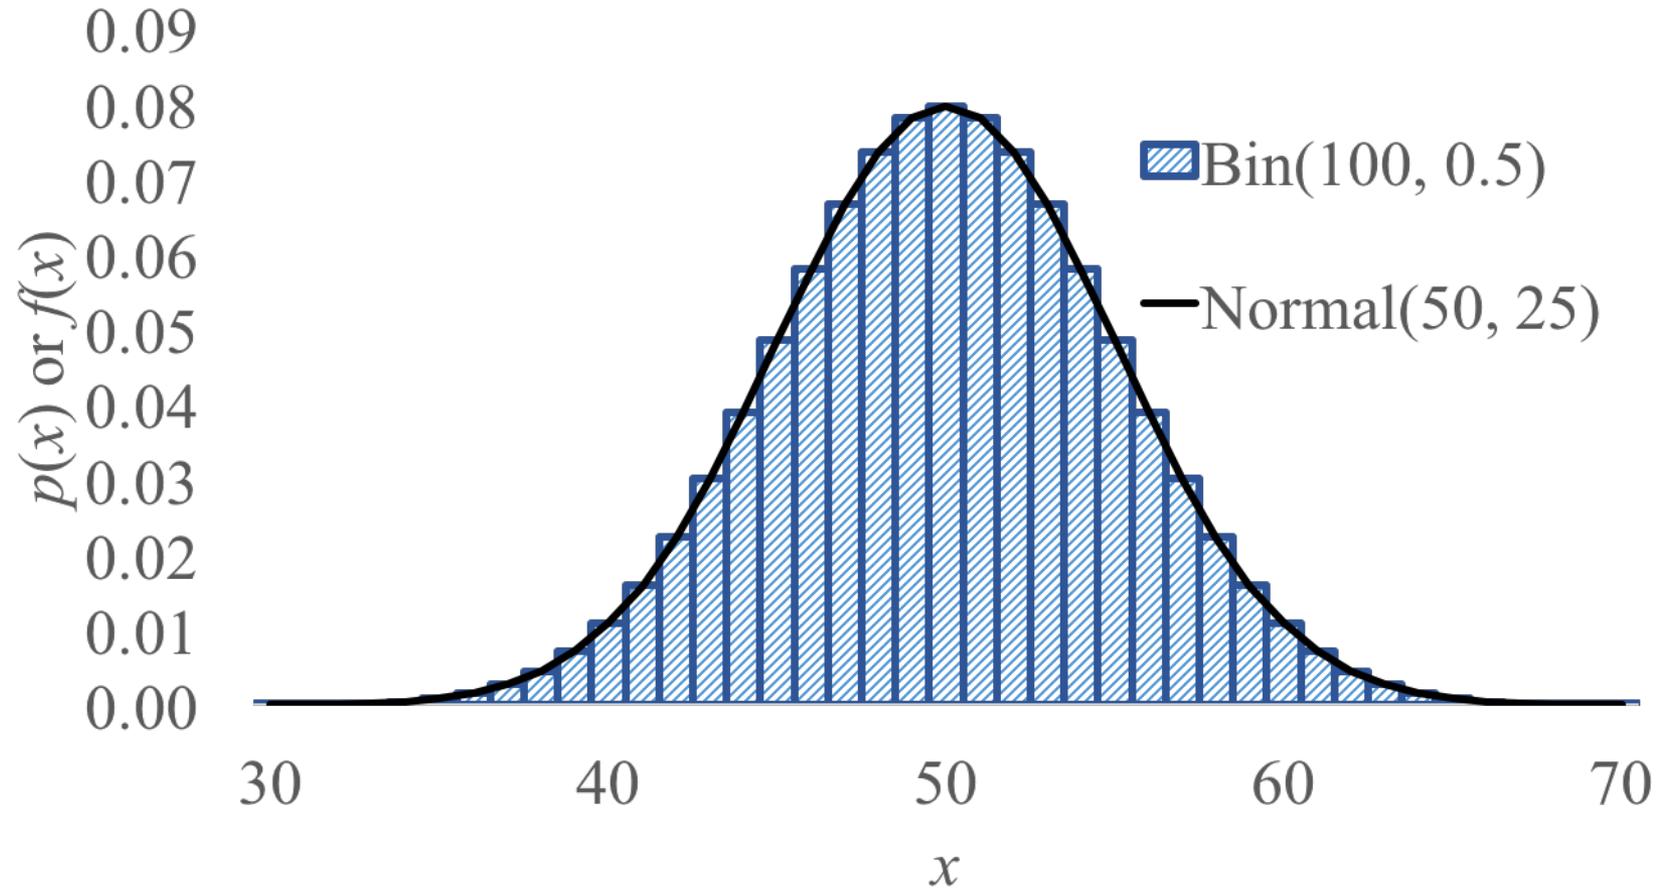

Normal Approximates Binomial

There is a deep reason for the Binomial/Normal similarity...

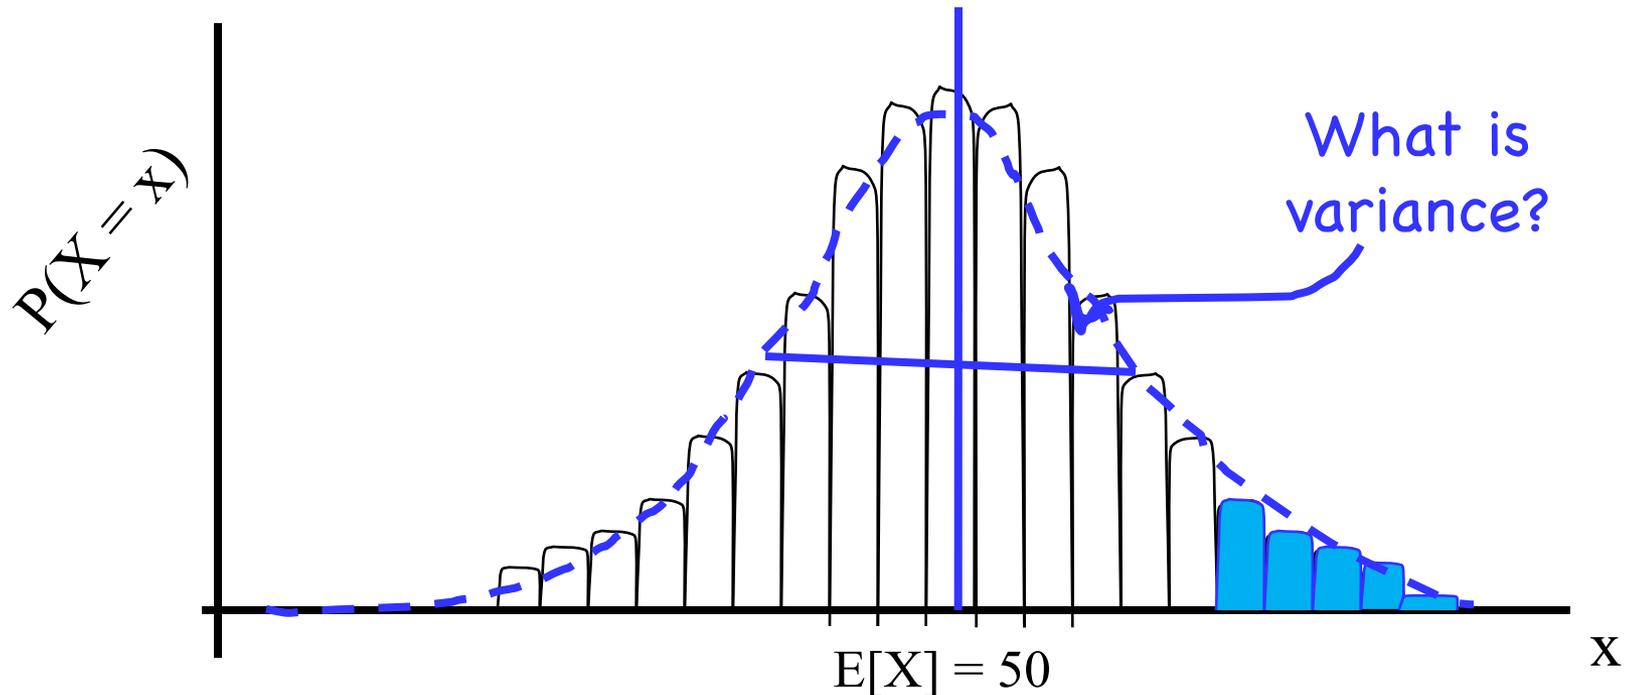

Normal Approximates Binomial

Let's invent an approximation!

Website Testing

- 100 people are given a new website design
 - $X = \#$ people whose time on site increases
 - CEO will endorse new design if $X \geq 65$ What is $P(\text{CEO endorses change} | \text{it has no effect})$?
 - $X \sim \text{Bin}(100, 0.5)$. Want to calculate $P(X \geq 65)$

Website Testing

- 100 people are given a new website design
 - $X = \#$ people whose time on site increases
 - CEO will endorse new design if $X \geq 65$ What is $P(\text{CEO endorses change} | \text{it has no effect})$?
 - $X \sim \text{Bin}(100, 0.5)$. Want to calculate $P(X \geq 65)$

$$np = 50 \quad np(1-p) = 25 \quad \sqrt{np(1-p)} = 5$$

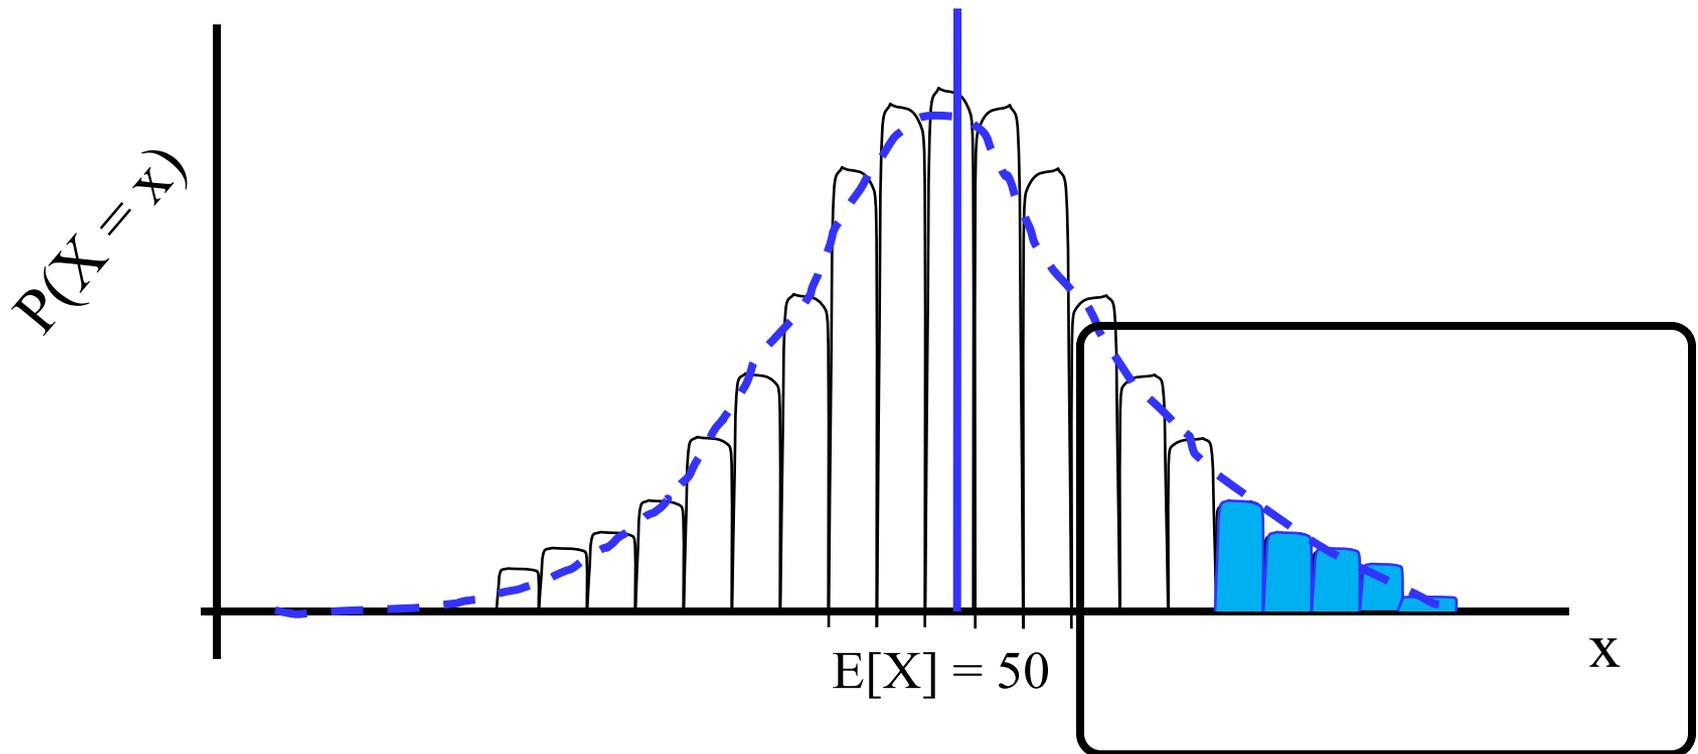

- Use Normal approximation: $Y \sim N(50, 25)$

$$P(Y \geq 65) = P\left(\frac{Y - 50}{5} > \frac{65 - 50}{5}\right) = P(Z > 3) = 1 - \phi(3) \approx 0.0013$$

- Using Binomial: $P(X \geq 65) \approx 0.0018$

Website Testing

Continuity Correction

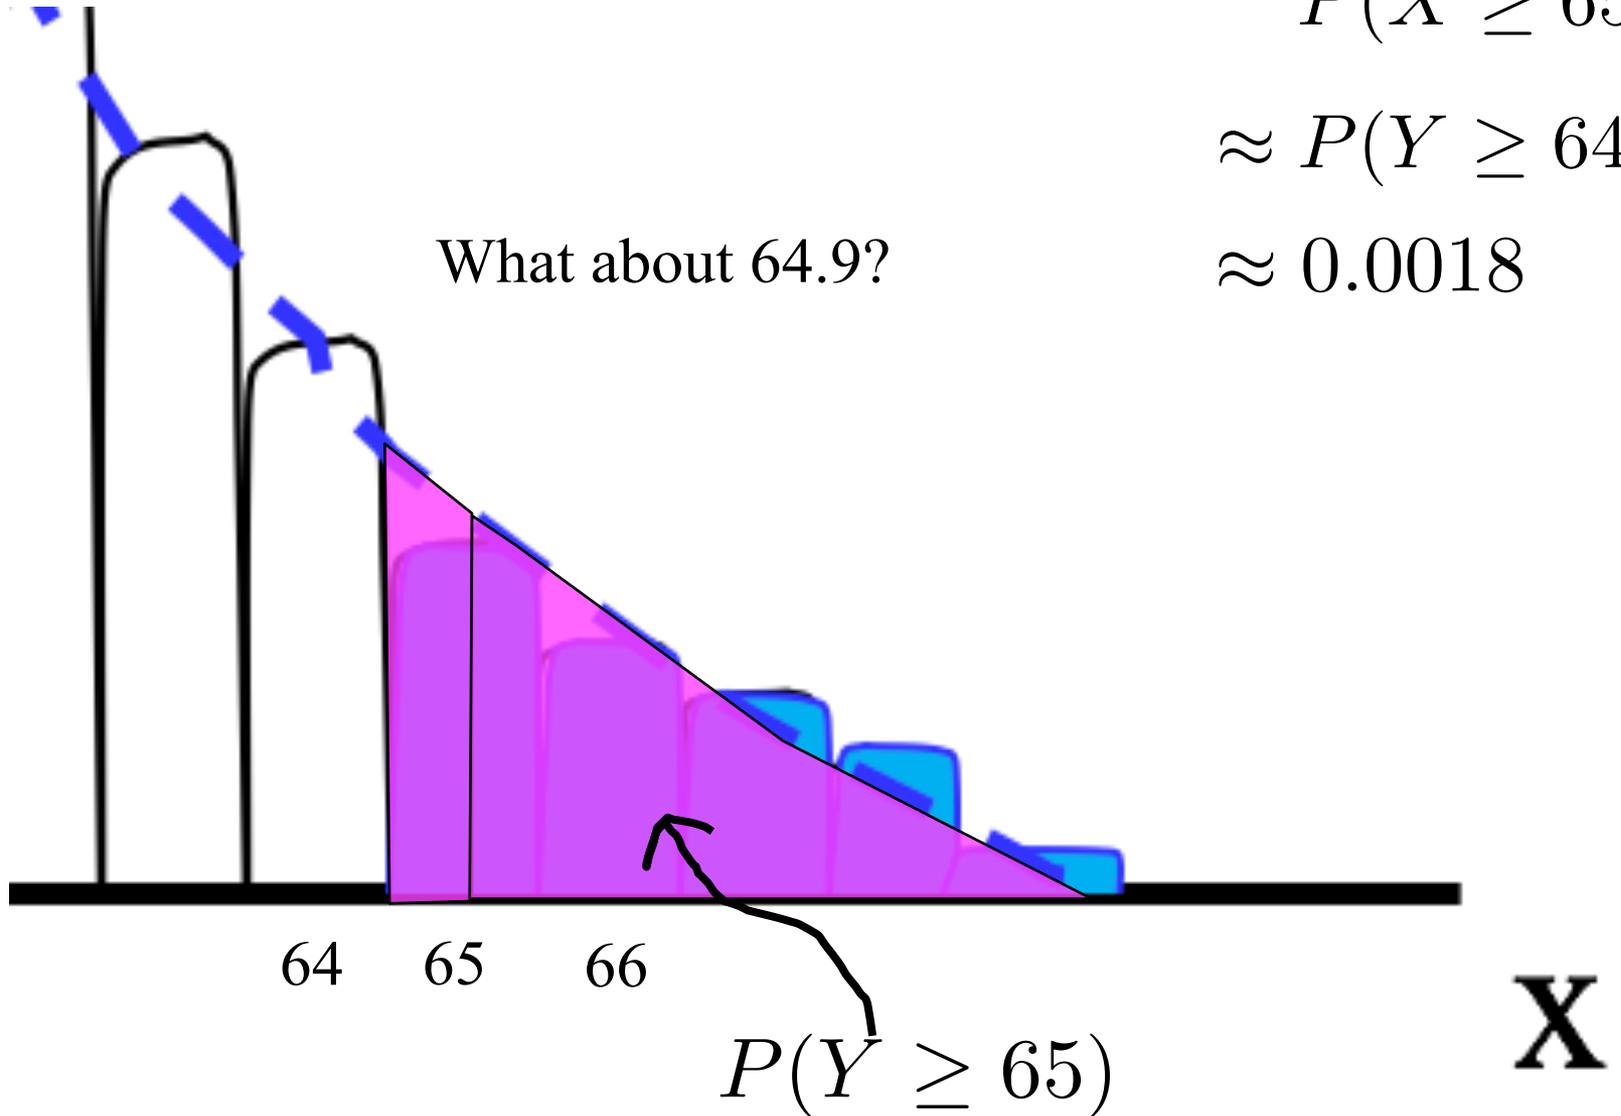

If Y (normal) approximates X (binomial)

$$P(X \geq 65)$$

$$\approx P(Y \geq 64.5)$$

What about 64.9?

$$\approx 0.0018$$

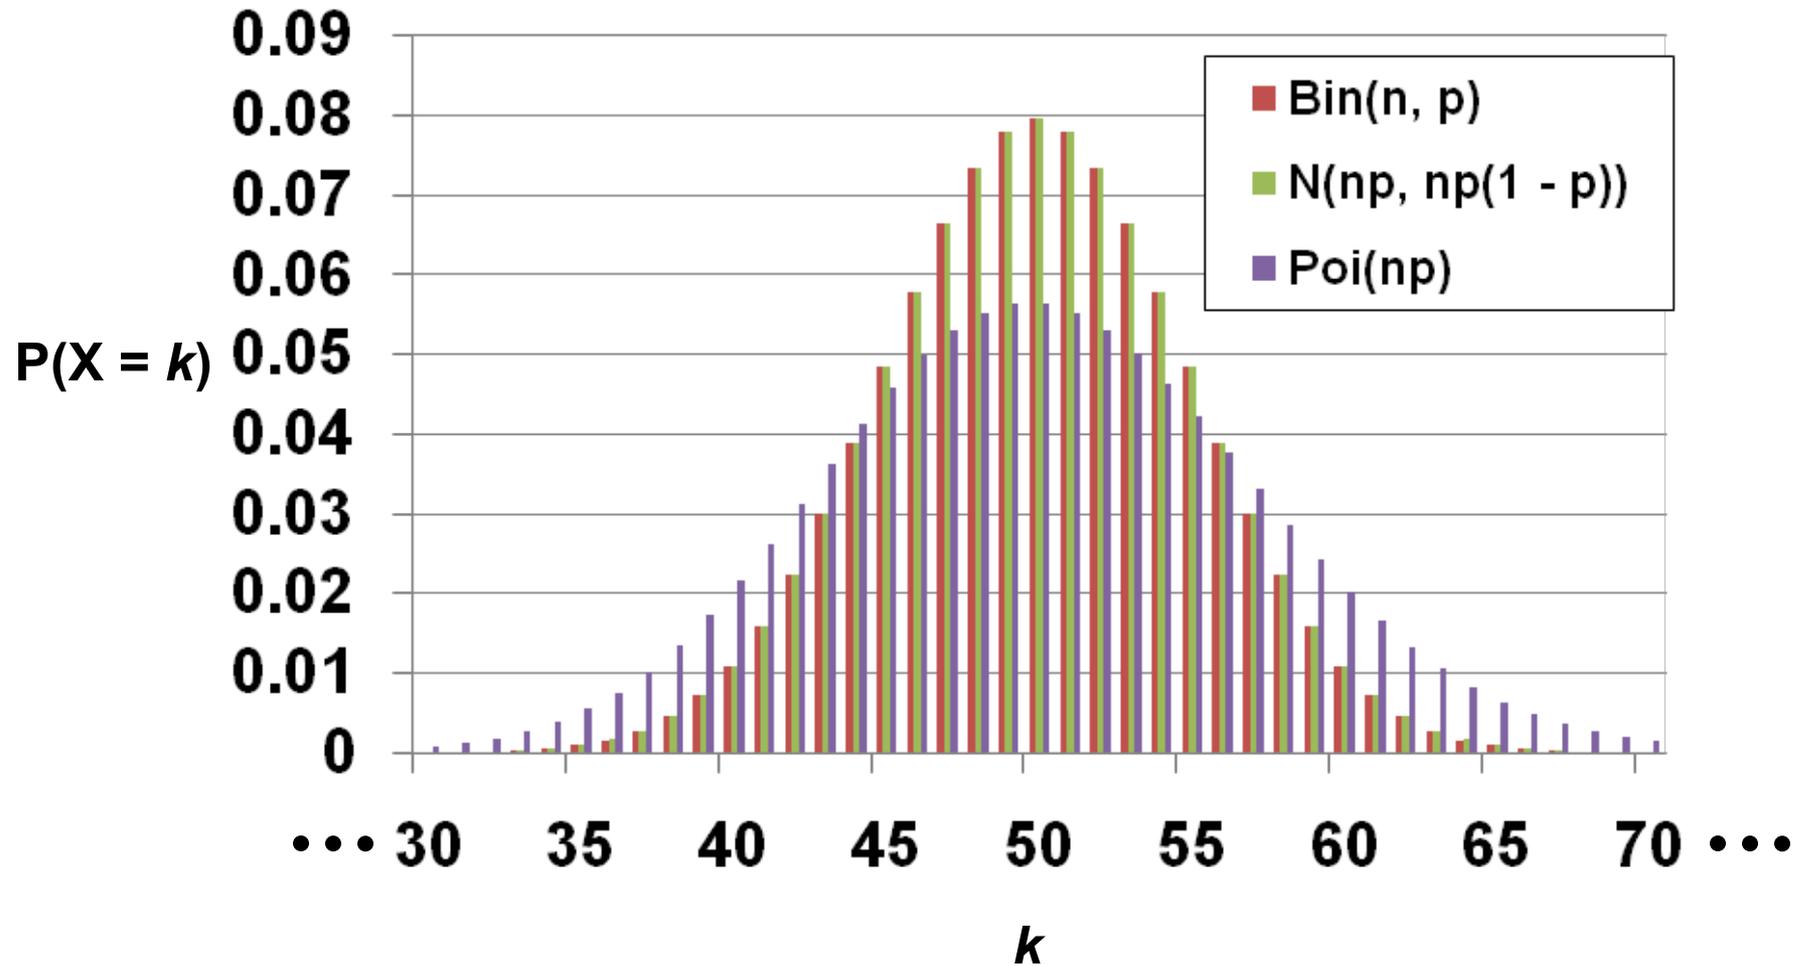

Continuity Correction

If Y (normal) approximates X (binomial)

Discrete (eg Binomial) probability question	Continuous (Normal) probability question
$X = 6$	$5.5 < Y < 6.5$
$X \geq 6$	$Y > 5.5$
$X > 6$	$Y > 6.5$
$X < 6$	$Y < 5.5$
$X \leq 6$	$Y < 6.5$

* Note: Binomial is always defined in units of “1”

Comparison when $n = 100, p = 0.5$

Who Gets to Approximate?

$$X \sim \text{Bin}(n, p)$$

Poisson approx.
 n large (> 20),
 p small (< 0.05)

Normal approx.
 n large (> 20),
 p is mid-ranged
 $np(1-p) > 10$

If there is a choice, go with the normal approximation

Stanford Admissions

- Stanford accepts 2050 students this year
 - Each accepted student has 84% chance of attending
 - $X = \#$ students who will attend. $X \sim \text{Bin}(2050, 0.84)$
 - What is $P(X > 1745)$?

$$np = 1722 \quad np(1 - p) = 276 \quad \sqrt{np(1 - p)} = 16.6$$

- Use Normal approximation: $Y \sim N(1722, 276)$

$$P(X > 1745) \approx P(Y > 1745.5)$$

$$P(Y \geq 1745.5) = P\left(\frac{Y - 1722}{16.6} > \frac{1745.5 - 1722}{16.6}\right) = P(Z > 1.4)$$

$$\approx 0.08$$

Changes in Stanford Admissions

Class of 2020 Admit Rates Lowest in University History

“Fewer students were admitted to the Class of 2020 than the Class of 2019, due to the increase in Stanford’s yield rate which has increased over 5 percent in the past four years, according to Colleen Lim M.A. ’80, Director of Undergraduate Admission.”

68% 10 years ago

84% last year

Continuous Random Variables

Uniform Random Variable $X \sim Uni(\alpha, \beta)$

All values of x between α and β are equally likely.

Normal Random Variable $X \sim \mathcal{N}(\mu, \sigma^2)$

Aka Gaussian. Defined by mean and variance. Goldilocks distribution.

Exponential Random Variable $X \sim Exp(\lambda)$

Time until an event happens. Parameterized by λ (same as Poisson).

Beta Random Variable

How mysterious and curious. You must wait a few classes 😊.

Joint Distributions

Ode to the Thai Café (demo)

Events occur with other events

Probability Table for Discrete

- States all possible outcomes with several discrete variables
- A probability table is not “parametric”
- If #variables is > 2 , you can have a probability table, but you can't draw it on a slide

All values of A

	0	1	2
All values of B	0		Every outcome falls into a bucket
	1	$P(A = 1, B = 1)$	
	2	Here “,” means “and”	

Discrete Joint Mass Function

- For two discrete random variables X and Y , the **Joint Probability Mass Function** is:

$$p_{X,Y}(a,b) = P(X = a, Y = b)$$

- Marginal distributions:

$$p_X(a) = P(X = a) = \sum_y p_{X,Y}(a, y)$$

$$p_Y(b) = P(Y = b) = \sum_x p_{X,Y}(x, b)$$

- Example: X = value of die D_1 , Y = value of die D_2

$$P(X = 1) = \sum_{y=1}^6 p_{X,Y}(1, y) = \sum_{y=1}^6 \frac{1}{36} = \frac{1}{6}$$

A Computer (or Three) In Every House

- Consider households in Silicon Valley
 - A household has X Macs and Y PCs
 - Can't have more than 3 Macs or 3 PCs

$Y \backslash X$	0	1	2	3	$p_Y(y)$
0	0.16	0.12	?	0.04	
1	0.12	0.14	0.12	0	
2	0.07	0.12	0	0	
3	0.04	0	0	0	
$p_X(x)$					

A Computer (or Three) In Every House

- Consider households in Silicon Valley
 - A household has X Macs and Y PCs
 - Can't have more than 3 Macs or 3 PCs

$Y \backslash X$	0	1	2	3	$p_Y(y)$
0	0.16	0.12	0.07	0.04	
1	0.12	0.14	0.12	0	
2	0.07	0.12	0	0	
3	0.04	0	0	0	
$p_X(x)$					

A Computer (or Three) In Every House

- Consider households in Silicon Valley
 - A household has X Macs and Y PCs
 - Can't have more than 3 Macs or 3 PCs

$Y \backslash X$	0	1	2	3	$p_Y(y)$
0	0.16	0.12	0.07	0.04	0.39

2	0.07	0.12	0	0	0.19
3	0.04	0	0	0	0.04
$p_X(x)$	0.39	0.38	0.19	0.04	1.00

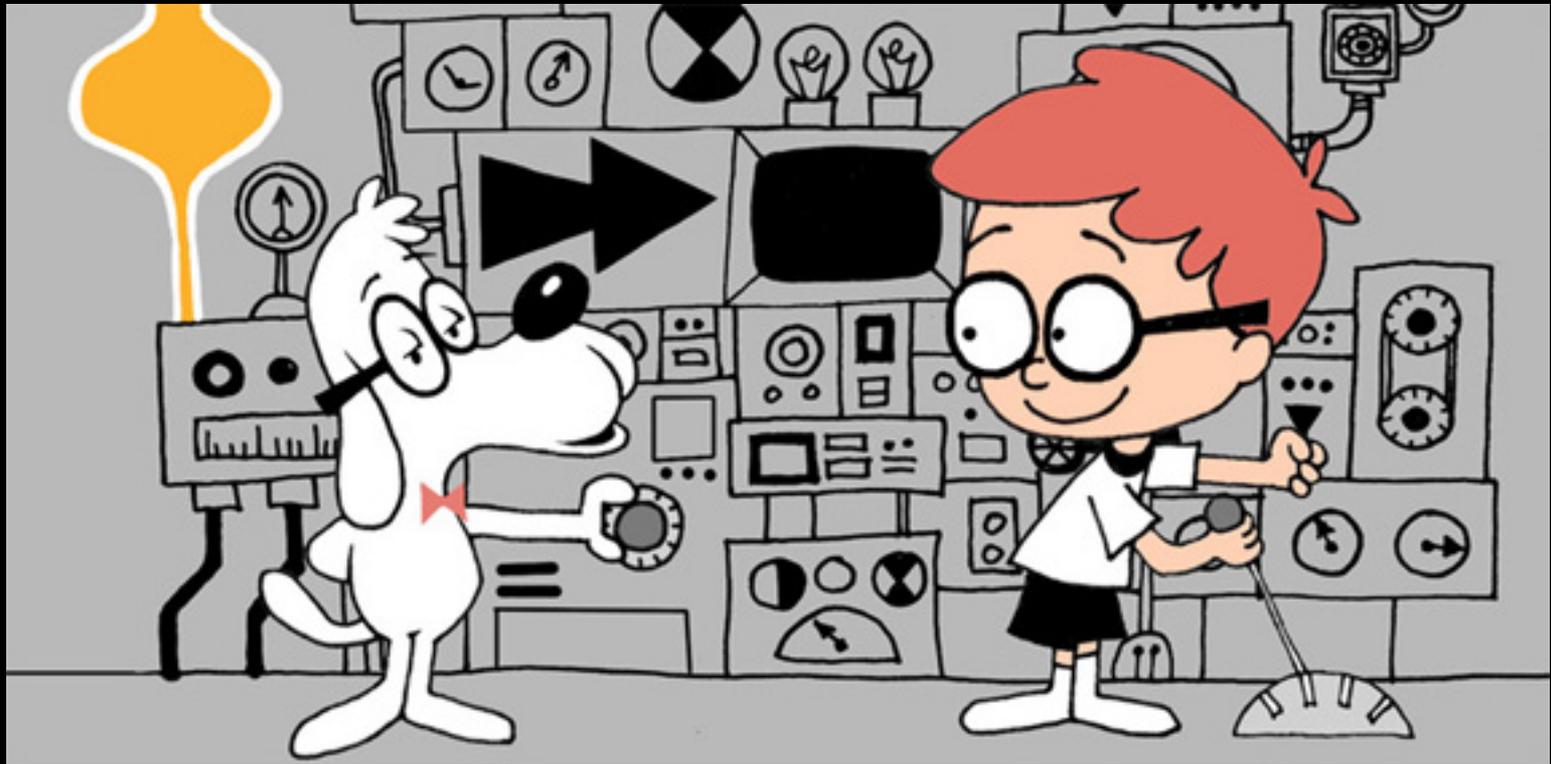

Marginal distributions

Ode to the Thai Café (demo)

Let's see the results!

Way Back

Permutations

How many ways are there to order n distinct objects?

$$n!$$

Binomial

How many ways are there to make an unordered selection of r objects from n objects?

How many ways are there to order n objects such that:
 r are the same (indistinguishable)
 $(n - r)$ are the same (indistinguishable)?

$$\frac{n!}{r!(n - r)!} = \binom{n}{r}$$

Called the “binomial” because of something from Algebra

Multinomial

How many ways are there to order n objects such that:

n_1 are the same (indistinguishable)

n_2 are the same (indistinguishable)

...

n_r are the same (indistinguishable)?

$$\frac{n!}{n_1!n_2!\dots n_r!} = \binom{n}{n_1, n_2, \dots, n_r}$$

Note: Multinomial $>$ Binomial

Binomial Distribution

- Consider n independent trials of Ber(p) rand. var.
 - X is number of successes in n trials
 - X is a **Binomial** Random Variable: $X \sim \text{Bin}(n, p)$

Binomial # ways
of ordering the
successes

$$P(X = i) = p(i) = \binom{n}{i} p^i (1-p)^{n-i} \quad i = 0, 1, \dots, n$$

Probability of
exactly i
successes

Probability of each
ordering of i
successes is equal +
mutually exclusive

End Way Back

Welcome Back the Multinomial

- Multinomial distribution
 - n independent trials of experiment performed
 - Each trial results in one of m outcomes, with respective probabilities: p_1, p_2, \dots, p_m where $\sum_{i=1}^m p_i = 1$
 - $X_i =$ number of trials with outcome i

$$P(X_1 = c_1, X_2 = c_2, \dots, X_m = c_m) = \binom{n}{c_1, c_2, \dots, c_m} p_1^{c_1} p_2^{c_2} \dots p_m^{c_m}$$

Joint distribution

Multinomial # ways of ordering the successes

Probabilities of each ordering are equal and mutually exclusive

where $\sum_{i=1}^m c_i = n$ and $\binom{n}{c_1, c_2, \dots, c_m} = \frac{n!}{c_1! c_2! \dots c_m!}$

Hello Die Rolls, My Old Friends

- 6-sided die is rolled 7 times
 - Roll results: 1 one, 1 two, 0 three, 2 four, 0 five, 3 six

$$P(X_1 = 1, X_2 = 1, X_3 = 0, X_4 = 2, X_5 = 0, X_6 = 3) \\ = \frac{7!}{1!1!0!2!0!3!} \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^1 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^2 \left(\frac{1}{6}\right)^0 \left(\frac{1}{6}\right)^3 = 420 \left(\frac{1}{6}\right)^7$$

- This is generalization of Binomial distribution
 - Binomial: each trial had 2 possible outcomes
 - Multinomial: each trial has m possible outcomes

Probabilistic Text Analysis

- Ignoring order of words, what is probability of any given word you write in English?
 - $P(\text{word} = \text{"the"}) > P(\text{word} = \text{"transatlantic"})$
 - $P(\text{word} = \text{"Stanford"}) > P(\text{word} = \text{"Cal"})$
 - Probability of each word is just multinomial distribution
- What about probability of those same words in someone else's writing?
 - $P(\text{word} = \text{"probability"} \mid \text{writer} = \text{you}) >$
 $P(\text{word} = \text{"probability"} \mid \text{writer} = \text{non-CS109 student})$
 - After estimating $P(\text{word} \mid \text{writer})$ from known writings, use Bayes' Theorem to determine $P(\text{writer} \mid \text{word})$ for new writings!

Text is a Multinomial

Example document:

“Pay for Viagra with a credit-card. Viagra is great.
So are credit-cards. Risk free Viagra. Click for free.”

$n = 18$

$$P \left(\begin{array}{l} \text{Viagra} = 2 \\ \text{Free} = 2 \\ \text{Risk} = 1 \\ \text{Credit-card: } 2 \\ \dots \\ \text{For} = 2 \end{array} \middle| \text{spam} \right) = \frac{n!}{2!2! \dots 2!} p_{\text{viagra}}^2 p_{\text{free}}^2 \dots p_{\text{for}}^2$$

It's a Multinomial!
