Probability of “OR”

OR with Mutually Exclusive Events

If events are mutually exclusive, probability of OR is simple:

$$P(E \cup F) = P(E) + P(F)$$

OR with Mutually Exclusive Events

If events are mutually exclusive, probability of OR is simple:

$$P(E \cup F) = \frac{7}{50} + \frac{4}{50} = \frac{11}{50}$$

OR with Many Mutually Exclusive Events

$$P(X_1 \cup X_2 \cup \cdots \cup X_n) = \sum_{i=1}^n P(X_i)$$

If events are *mutually exclusive* probability of OR is easy!

What about when they are not
Mutually exclusive?

OR without Mutually Exclusivity

AKA
Inclusion Exclusion

$$P(E \cup F) = P(E) + P(F) - P(EF)$$

OR without Mutually Exclusivity

$$P(E \cup F) = \frac{8}{50} + \frac{14}{50} - \frac{3}{50} = \frac{19}{50}$$

More than two sets?

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) =$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E)$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E) + P(F) + P(G) - P(E \cap F) - P(E \cap G) - P(F \cap G) + P(E \cap F \cap G)$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E) + P(F) + P(G) - P(E \cap F) - P(E \cap G) - P(F \cap G) + P(E \cap F \cap G)$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E) + P(F) + P(G) - P(EF)$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E) + P(F) + P(G) \\ - P(EF) - P(EG)$$

Inclusion Exclusion with Three Sets

$$P(E \cup F \cup G) = P(E) + P(F) + P(G) \\ - P(EF) - P(EG) - P(FG)$$

Inclusion Exclusion with Three Sets

$$\begin{aligned} P(E \cup F \cup G) = & P(E) + P(F) + P(G) \\ & - P(EF) - P(EG) - P(FG) \\ & + P(EFG) \end{aligned}$$

General Inclusion Exclusion

$$P(E_1 \cup E_2 \cup \cdots \cup E_n) = \sum_{r=1}^n (-1)^{r+1} Y_r$$

* Where Y_r is the sum, for all combinations of r events, of the probability of the union those events.

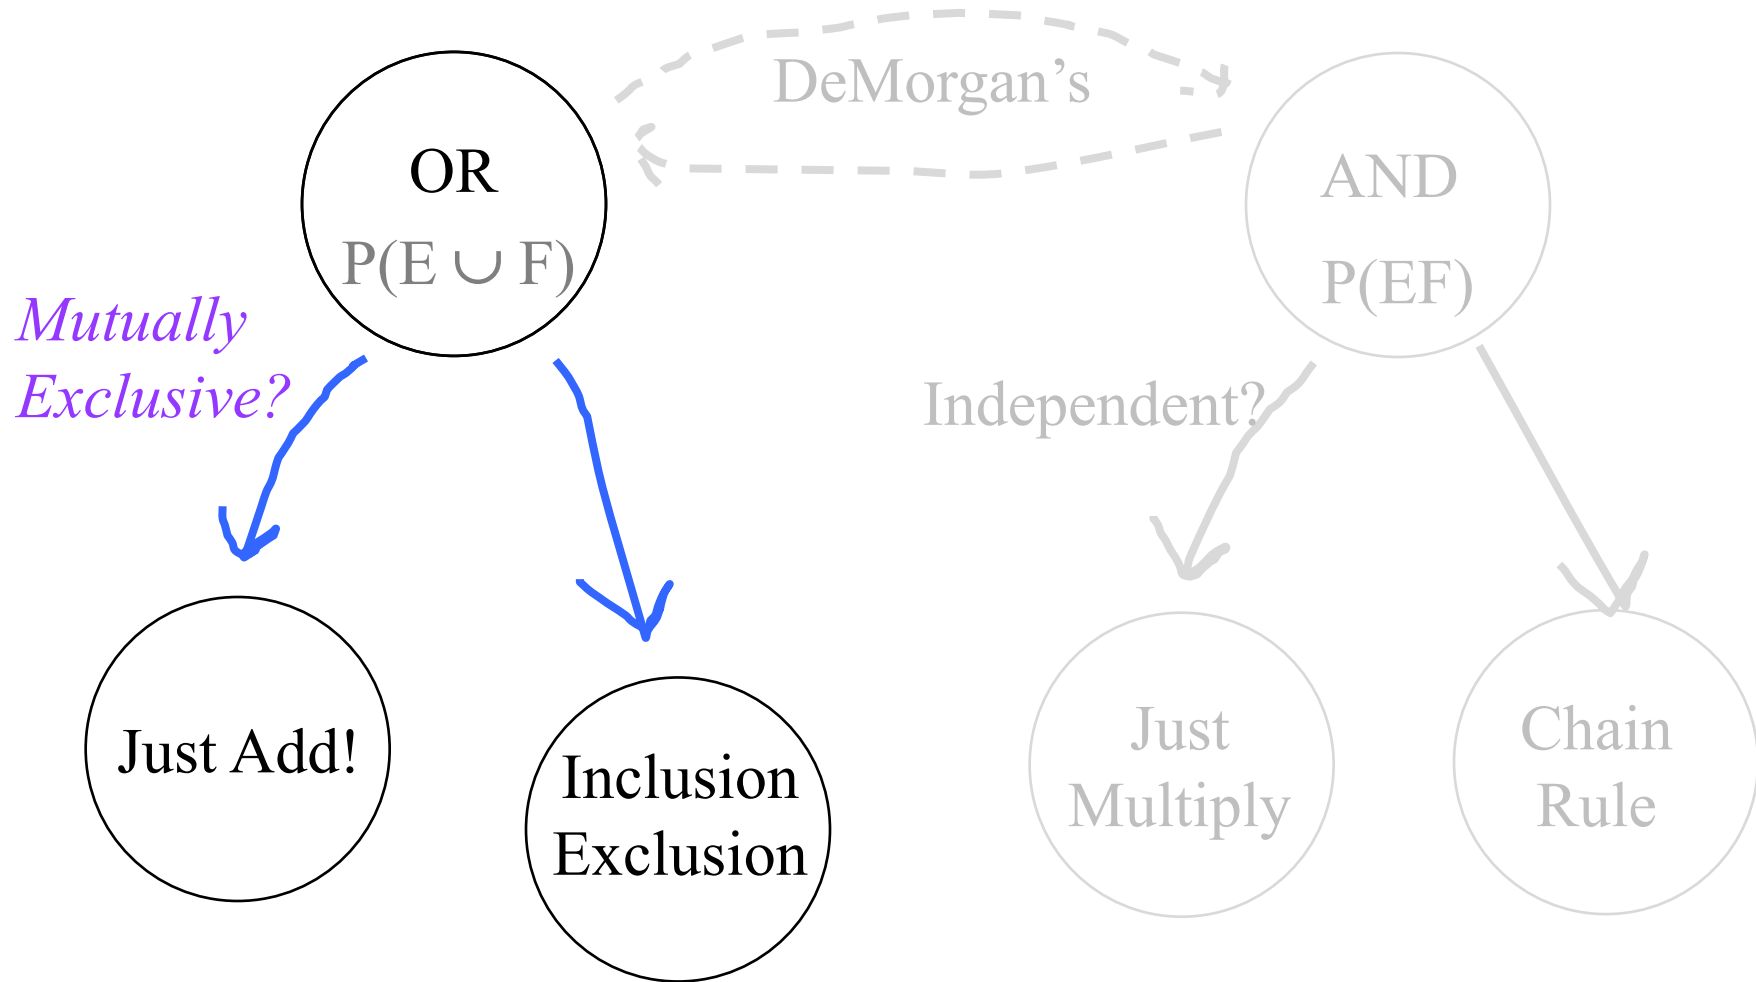

$$Y_1 = \text{Sum of all events on their own} \quad \sum_i P(E_i)$$

$$Y_2 = \text{Sum of all pairs of events} \quad \sum_{i,j \text{ s.t. } i \neq j} P(E_i \cap E_j)$$

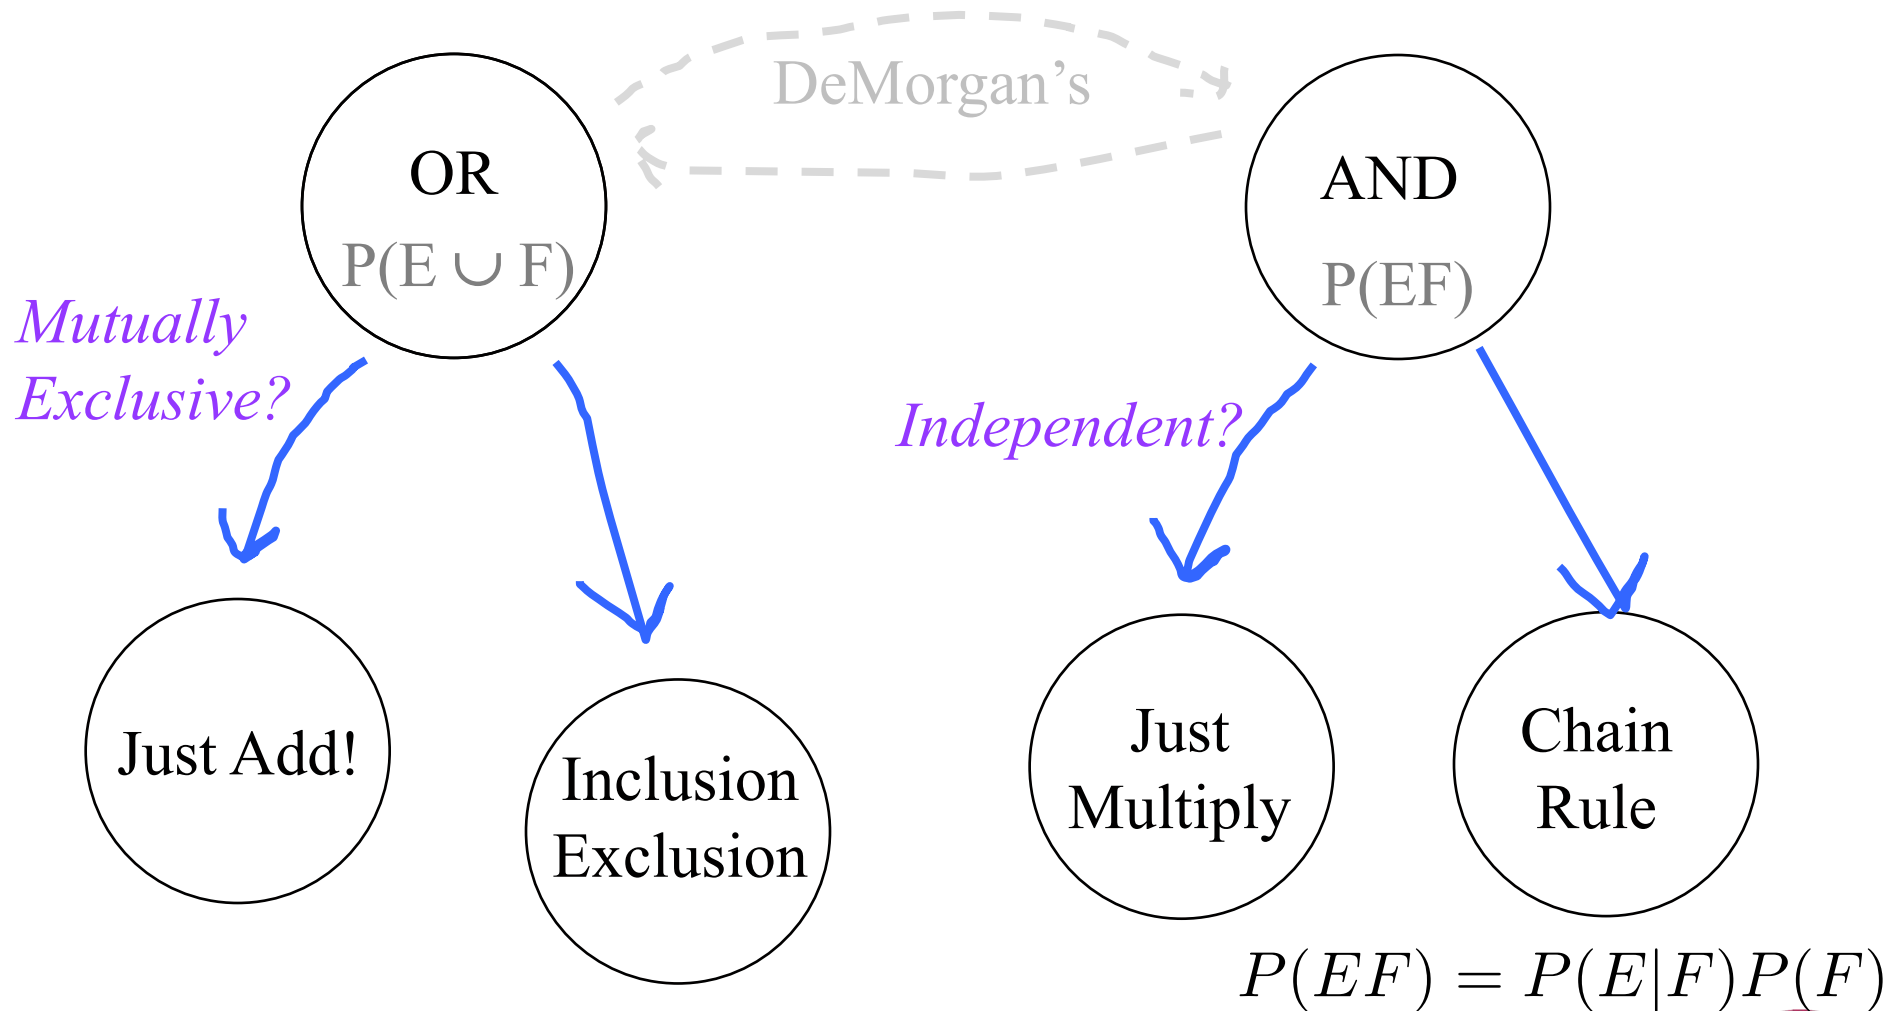

$$Y_3 = \text{Sum of all triples of events} \quad \sum_{i,j,k \text{ s.t. } i \neq j, j \neq k, i \neq k} P(E_i \cap E_j \cap E_k)$$

Probability of “AND”

A close-up photograph of the United States Constitution. A quill pen lies horizontally across the top of the document. The parchment is aged and yellowed. The stars and stripes of the American flag are visible in the bottom right corner.

We the People of the United States, in order to form a more perfect Union, to insure domestic Tranquility, provide for the common defence and our Posterity, do ordain and establish this Constitution.

Article I
Section 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Independence

Two events A and B are called independent if:

$$P(AB) = P(A)P(B)$$

Otherwise, they are called dependent events

If events are *independent*
probability of AND is easy!

*You will need to use this “trick” with high probability

Intuition through proofs

Let A and B be independent

$$P(A|B) = \frac{P(AB)}{P(B)}$$

Definition of
conditional probability

$$= \frac{P(A)P(B)}{P(B)}$$

Since A and B are
independent

$$= P(A)$$

Taking the bus to
cancel city

Knowing that event B happened, doesn't change
our belief that A will happen.

Dice, Our Misunderstood Friends

- Roll two 6-sided dice, yielding values D_1 and D_2
 - Let E be event: $D_1 = 1$
 - Let F be event: $D_2 = 1$
- What is $P(E)$, $P(F)$, and $P(EF)$?
 - $P(E) = 1/6$, $P(F) = 1/6$, $P(EF) = 1/36$
 - $P(EF) = P(E) P(F) \rightarrow E$ and F independent
- Let G be event: $D_1 + D_2 = 5 \quad \{(1, 4), (2, 3), (3, 2), (4, 1)\}$
- What is $P(E)$, $P(G)$, and $P(EG)$?
 - $P(E) = 1/6$, $P(G) = 4/36 = 1/9$, $P(EG) = 1/36$
 - $P(EG) \neq P(E) P(G) \rightarrow E$ and G dependent

What does independence look like?

Independence?

S

Independence Definition 1:

$$P(AB) = P(A)P(B)$$

$$\frac{|AB|}{|S|} = \frac{|A|}{|S|} \times \frac{|B|}{|S|}$$

A blue arrow points from the $|AB|$ term in the numerator of the left fraction to a blue superscript 0 above the $|S|$ term in the denominator of the right fraction, indicating that the joint probability of two independent events is the product of their individual probabilities.

Independence

Independence Definition 1:

$$P(AB) = P(A)P(B)$$

$$\frac{|AB|}{|S|} = \frac{|A|}{|S|} \times \frac{|B|}{|S|}$$

Independence Definition 2:

$$P(A|B) = P(A)$$

$$\frac{|AB|}{|B|} = \frac{|A|}{|S|}$$

Independence

This ratio, $P(A)$...

S

... is the same as this one, $P(A|B)$

Independence

Independence Definition 1:

$$P(AB) = P(A)P(B)$$

$$\frac{|AB|}{|S|} = \frac{|A|}{|S|} \times \frac{|B|}{|S|}$$

Independence Definition 2:

$$P(A|B) = P(A)$$

$$\frac{|AB|}{|B|} = \frac{|A|}{|S|}$$

More Intuition through proofs:

Independence

Given independent events A and B , prove that A and B^C are independent

We want to show that $P(AB^C) = P(A)P(B^C)$

$$\begin{aligned}P(AB^C) &= P(A) - P(AB) && \text{By Total Law of Prob.} \\&= P(A) - P(A)P(B) && \text{By independence} \\&= P(A)[1 - P(B)] && \text{Factoring} \\&= P(A)P(B^C) && \text{Since } P(B) + P(B^C) = 1\end{aligned}$$

So if A and B are independent A and B^C are also independent

Generalization

Generalized Independence

- General definition of Independence:

Events E_1, E_2, \dots, E_n are independent if **for every subset** with r elements (where $r \leq n$) it holds that:

$$P(E_1, E_2, E_3, \dots, E_r) = P(E_1)P(E_2)P(E_3) \dots P(E_r)$$

- Example: outcomes of n separate flips of a coin are all independent of one another
 - Each flip in this case is called a “trial” of the experiment

Math > Intuition

Two Dice

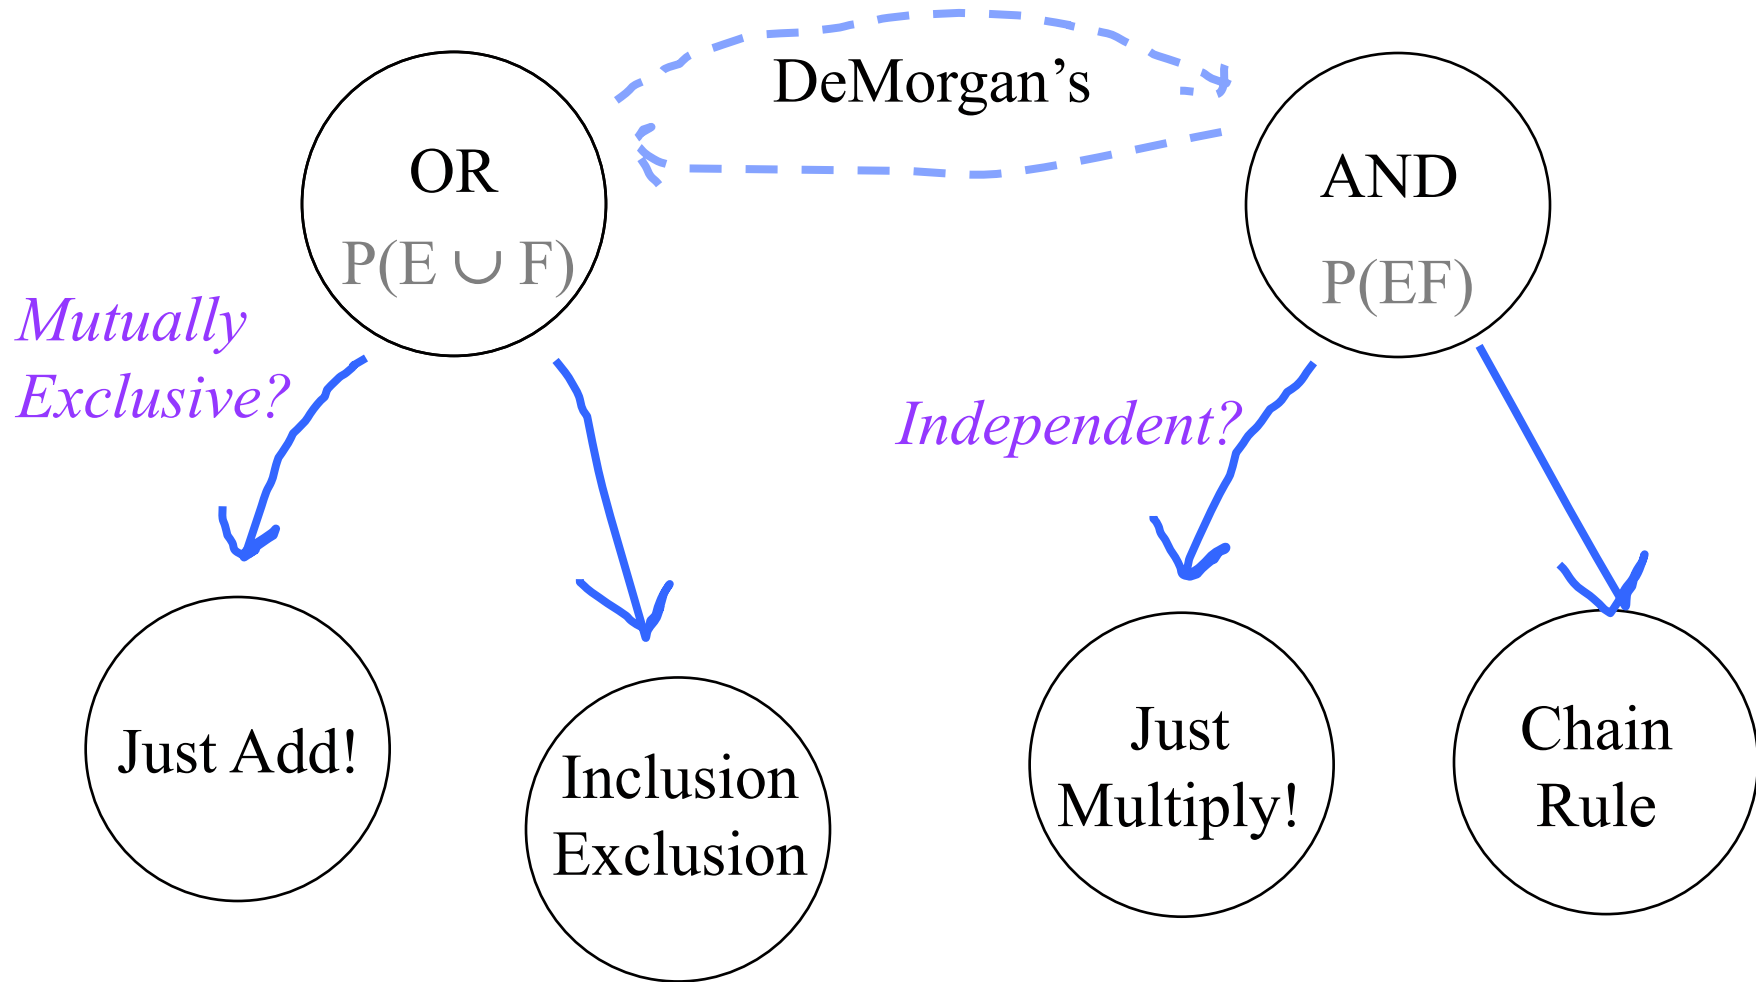

- Roll two 6-sided dice, yielding values D_1 and D_2
 - Let E be event: $D_1 = 1$
 - Let F be event: $D_2 = 6$
 - Are E and F independent? **Yes!**
- Let G be event: $D_1 + D_2 = 7$
 - Are E and G independent? **Yes!**
 - $P(E) = 1/6$, $P(G) = 1/6$, $P(E \cap G) = 1/36$ [roll (1, 6)]
 - Are F and G independent? **Yes!**
 - $P(F) = 1/6$, $P(G) = 1/6$, $P(F \cap G) = 1/36$ [roll (1, 6)]
 - Are E, F and G independent? **No!**
 - $P(EFG) = 1/36 \neq 1/216 = (1/6)(1/6)(1/6)$

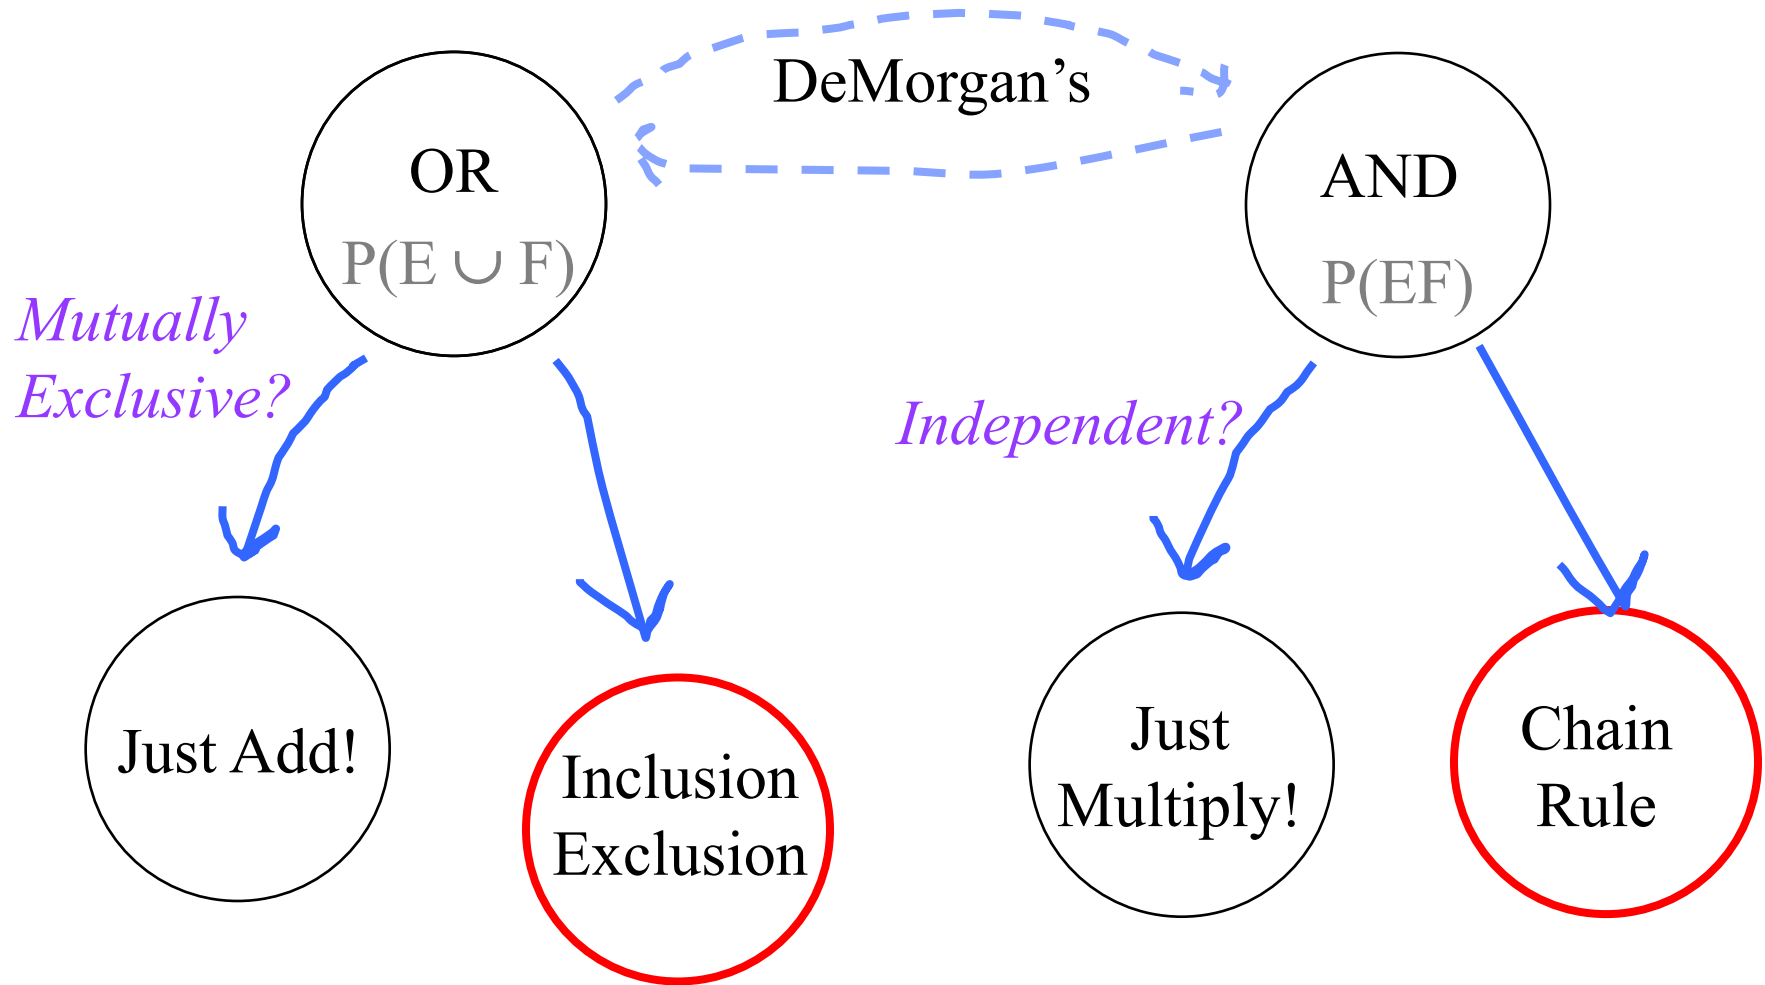

New Ability

Today

Today

Use the two properties
(mutual exclusion and
independence)

Sending a Message Through Network

- Consider the following parallel network:

- n independent routers, each with probability p_i of functioning (where $1 \leq i \leq n$)
- E = functional path from A to B exists. What is $P(E)$?

Sending a Message Through Network

- Consider the following parallel network:

- n **independent** routers, each with probability p_i of functioning (where $1 \leq i \leq n$)
- E = functional path from A to B exists. What is $P(E)$?

Sending a Message Through Network

- Consider the following parallel network:

- n **independent** routers, each with probability p_i of functioning (where $1 \leq i \leq n$)
 - E = functional path from A to B exists. What is $P(E)$?
- Solution:

- $$\begin{aligned} P(E) &= 1 - P(\text{all routers fail}) \\ &= 1 - (1 - p_1)(1 - p_2) \dots (1 - p_n) \\ &= 1 - \prod_{i=1}^n (1 - p_i) \end{aligned}$$

Coin Flips

- Say a coin comes up heads with probability p
 - Each coin flip is an **independent** trial
- $P(n \text{ heads on } n \text{ coin flips}) = p^n$
- $P(n \text{ tails on } n \text{ coin flips}) = (1 - p)^n$
- $P(\text{first } k \text{ heads, then } n - k \text{ tails}) = p^k (1 - p)^{n-k}$
- $P(\text{exactly } k \text{ heads on } n \text{ coin flips}) = ?$

Explain...

$$P(\text{exactly } k \text{ heads on } n \text{ coin flips})? \quad \binom{n}{k} p^k (1-p)^{n-k}$$

Think of the flips as ordered:

Ordering 1: T, H, H, T, T, T....

Ordering 2: H, T, H, T, T, T....

And so on...

The coin flips are
independent!

$$P(F_i) = p^k (1-p)^{n-k}$$

Let's make each ordering with k heads an event... F_i

$$P(\text{exactly } k \text{ heads on } n \text{ coin flips}) = P(\text{any one of the events})$$

$$P(\text{exactly } k \text{ heads on } n \text{ coin flips}) = P(F_1 \text{ or } F_2 \text{ or } F_3 \dots)$$

Those events are mutually exclusive!

Hash Tables

- m strings are hashed (unequally) into a hash table with n buckets
 - Each string hashed is an **independent** trial, with probability p_i of getting hashed to bucket i
 - E = at least one string hashed to first bucket
 - What is $P(E)$?
- Solution

To the white board

Hash Tables

- m strings are hashed (unequally) into a hash table with n buckets
 - Each string hashed is an **independent** trial, with probability p_i of getting hashed to bucket i
 - $E =$ **at least one** string hashed to first bucket
 - What is $P(E)$?
- Solution

To the white board

Yet More Hash Tables

- m strings are hashed (unequally) into a hash table with n buckets
 - Each string hashed is an **independent** trial, with probability p_i of getting hashed to bucket i
 - $E =$ At least 1 of buckets 1 to k has ≥ 1 string hashed to it
- Solution
 - $F_i =$ at least one string hashed into i -th bucket
 - $$\begin{aligned} P(E) &= P(F_1 \cup F_2 \cup \dots \cup F_k) = 1 - P((F_1 \cup F_2 \cup \dots \cup F_k)^c) \\ &= 1 - P(F_1^c F_2^c \dots F_k^c) \quad (\text{DeMorgan's Law}) \end{aligned}$$
 - $$\begin{aligned} P(F_1^c F_2^c \dots F_k^c) &= P(\text{no strings hashed to buckets 1 to } k) \\ &= (1 - p_1 - p_2 - \dots - p_k)^m \end{aligned}$$
 - $$P(E) = 1 - (1 - p_1 - p_2 - \dots - p_k)^m$$

No, Really, More Hash Tables

=

- m strings are hashed (unequally) into a hash table with n buckets
 - Each string hashed is an **independent** trial, with probability p_i of getting hashed to bucket i
 - $E = \text{Each of}$ buckets 1 to k has ≥ 1 string hashed to it

No, Really, More Hash Tables

No, Really, More Hash Tables

- m strings are hashed (unequally) into a hash table with n buckets
 - Each string hashed is an independent trial, with probability p_i of getting hashed to bucket i
 - $E = \text{Each of}$ buckets 1 to k has ≥ 1 string hashed to it
- Solution
 - F_i = at least one string hashed into i -th bucket
 - $$\begin{aligned} P(E) &= P(F_1 F_2 \dots F_k) = 1 - P((F_1 F_2 \dots F_k)^c) \\ &= 1 - P(F_1^c \cup F_2^c \cup \dots \cup F_k^c) \quad (\text{DeMorgan's Law}) \\ &= 1 - P\left(\bigcup_{i=1}^k F_i^c\right) = 1 - \sum_{r=1}^k (-1)^{(r+1)} \sum_{i_1 < \dots < i_r} P(F_{i_1}^c F_{i_2}^c \dots F_{i_r}^c) \end{aligned}$$

where $P(F_{i_1}^c F_{i_2}^c \dots F_{i_r}^c) = (1 - p_{i_1} - p_{i_2} - \dots - p_{i_r})^m$

Phew!

Now two great tastes...

NETFLIX

And Learn

Netflix and Learn

What is the probability
that a user will watch
Life is Beautiful?

$$P(E)$$

$$P(E) = \lim_{n \rightarrow \infty} \frac{n(E)}{n} \approx \frac{\text{\#people who watched movie}}{\text{\#people on Netflix}}$$

$$P(E) = 10,234,231 / 50,923,123 = 0.20$$

Netflix and Learn

What is the probability
that a user will watch
Life is Beautiful, given
they watched Amelie?

$$P(E|F)$$

$$P(E|F) = \frac{P(EF)}{P(F)} = \frac{\text{\#people who watched both}}{\text{\#people who watched } F}$$

$$P(E|F) = 0.42$$

Netflix and Learn

Assume E_1, E_2, E_3 and E_4 are conditionally independent given K_1

Netflix and Learn

Assume E_1 , E_2 , E_3 and E_4 are conditionally independent given K_1

Conditional independence is a practical, real world way of decomposing hard probability questions.

Conditional Independence

If E and F are
dependent,

that does not mean E and
 F will be dependent
when another event
happens.

Conditional Dependence

If E and F are
independent,

that does not mean E and
 F will be independent
when another event
happens.

Big Deal

“Exploiting conditional independence to generate fast probabilistic computations is one of the main contributions CS has made to probability theory”

-Judea Pearl wins 2011 Turing Award, *“For fundamental contributions to artificial intelligence through the development of a calculus for probabilistic and causal reasoning”*
