Lecture Discussion on Ed
Summary of Combinatorics

Counting tasks on $n$ objects

- Sort objects (permutations)
  - Distinct (distinguishable)
    - $n!$
- Choose $k$ objects (combinations)
  - Some distinct
- Put objects in $r$ buckets
  - Relevant when order within selection does not matter

Lisa Yan, Chris Piech, Mehran Sahami, and Jerry Cain, CS109, Spring 2024
General approach to counting permutations

When there are $n$ objects such that
- $n_1$ are the same (indistinguishable or indistinct), and
- $n_2$ are the same, and
- ...
- $n_r$ are the same,

The number of unique orderings (permutations) is

$$\frac{n!}{n_1! n_2! \cdots n_r!}.$$

For each group of indistinct objects, divide by the overcounted permutations.

Simple example:

How many strings can be formed from the letters in: M A R R Y

Answer is: $\frac{5!}{1! 1! 2! 1!} = 60$
Sort semi-distinct objects

How many permutations?

\[
\text{number of distinct orderings is } \frac{6!}{2! \cdot 3!} = 10
\]
Strings

How many letter orderings are possible for the following strings?

1. **KIKIIRIAFIN**
   - 11 letters
   - 2 K's, 5 I's, one of all others
   - \( \frac{11!}{5!2!} \)

2. **EFFERVESCEENCE**
   - 13 letters
   - 2 F's, 5 E's, 2 C's, one of all others
   - \( \frac{13!}{2!5!2!} \)
Strings

How many letter orderings are possible for the following strings?

1. **KIKIIRIAFIN**  \[= \frac{11!}{5!2!} = 166,320\]

2. **EFFERVESCENTCE**  \[= \frac{13!}{2!5!2!} = 12,972,960\]
Unique 6-digit passcodes with four smudges

How many unique 6-digit passcodes are possible if a phone password uses each of four distinct numbers?

Two mutually exclusive scenarios:

- One digit repeated three times, other three repeated once
- Two digits repeated twice, other two repeated once
Unique 6-digit passcodes with four smudges

How many unique 6-digit passcodes are possible if a phone password uses each of four distinct numbers?

Two mutually exclusive scenarios:

- One digit repeated three times, other three repeated once
- Two digits repeated twice, other two repeated once

First scenario:
\[
4 \cdot \frac{6!}{3!} = 4 \cdot 60 = 480
\]

Second scenario:
\[
6 \cdot \frac{6!}{2!2!} = 6 \cdot 180 = 1080
\]
Unique 6-digit passcodes with **four** smudges

How many unique 6-digit passcodes are possible if a phone password uses each of **four** distinct numbers?

Two mutually exclusive scenarios:

• One digit repeated three times, other three repeated once
• Two digits repeated twice, other two repeated once

**First scenario:**

\[ n_1 = 4 \cdot \frac{6!}{3!} = 480 \]

**Second scenario:**

\[ n_2 = 6 \cdot \frac{6!}{2!2!} = 1080 \]

6 ways to choose two digits, the each appear twice:

2, 4, 5, 2, 4, 5, 2, 4, 5

Lisa Yan, Chris Piech, Mehran Sahami, and Jerry Cain, CS109, Spring 2024

Stanford University
Unique 6-digit passcodes with **four** smudges

How many unique 6-digit passcodes are possible if a phone password uses each of **four** distinct numbers?

Two mutually exclusive scenarios:
- One digit repeated three times, other three repeated once
- Two digits repeated twice, other two repeated once

**First Scenario:**

\[ n_1 = 4 \cdot \frac{6!}{3!} = 480 \]

**Second Scenario:**

\[ n_2 = 6 \cdot \frac{6!}{2!2!} = 1080 \]

**Total:** 1560 such passcodes
Summary of Combinatorics

Counting tasks on $n$ objects

- Sort objects (permutations)
- Choose $k$ objects (combinations)
- Put objects in $r$ buckets

Distinct (distinguishable)

Some distinct

\[
\begin{align*}
n! & \\
\frac{n!}{n_1!n_2!\cdots n_r!} & \\
\end{align*}
\]
Combinations I
Summary of Combinatorics

Counting tasks on $n$ objects

- Sort objects (permutations)
  - Distinct (distinguishable)
    - $n!$
  - Some distinct
    - $\frac{n!}{n_1!n_2!\cdots n_r!}$

- Choose $k$ objects (combinations)
  - Distinct

- Put objects in $r$ buckets
Combinations with cake

There are \( n = 20 \) people.

How many ways can we choose \( k = 5 \) people to get cake?

Consider the following generative process…
Combinations with cake

There are $n = 20$ people. How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line

$n!$ ways
Combinations with cake

There are $n = 20$ people.

How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line
   - $n!$ ways

2. Put first $k$ in cake room
   - 1 way
Combinations with cake

There are $n = 20$ people.

How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line
   - $n!$ ways

2. Put first $k$ in cake room
   - 1 way
Combinations with cake

There are $n = 20$ people.

How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line
   $n!$ ways

2. Put first $k$ in cake room
   1 way

3. Allow cake group to mingle
   $k!$ different permutations all considered the same group of children

Lisa Yan, Chris Piech, Mehran Sahami, and Jerry Cain, CS109, Spring 2024

Stanford University
Combinations with cake

There are $n = 20$ people. How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line
   - $n!$ ways
2. Put first $k$ in cake room
   - 1 way
3. Allow cake group to mingle
   - $k!$ different permutations all considered the same group of children
4. Allow non-cake group to mingle
Combinations with cake

There are $n = 20$ people.

How many ways can we choose $k = 5$ people to get cake?

1. $n$ people get in line
   - $n!$ ways

2. Put first $k$ in cake room
   - 1 way

3. Allow cake group to mingle
   - $k!$ different permutations all considered the same group of children

4. Allow non-cake group to mingle
   - $(n - k)!$ different permutations all lead to the same group of children
Combinations

A combination is an unordered selection of \( k \) objects from a set of \( n \) distinct objects.

The number of ways of making this selection is

\[
\frac{n!}{k! \, (n-k)!} = n! \times \frac{1}{k!} \times \frac{1}{(n-k)!}
\]

1. Order \( n \) distinct objects
2. Take first \( k \) as chosen
3. Overcounted: any ordering of chosen group is same choice
4. Overcounted: any ordering of unchosen group is same choice
Combinations

A combination is an unordered selection of \( k \) objects from a set of \( n \) distinct objects.

The number of ways of making this selection is

\[
\frac{n!}{k! \,(n-k)!} = n! \times 1 \times \frac{1}{k!} \times \frac{1}{(n-k)!} = \binom{n}{k}
\]

Binomial coefficient

Note: \( \binom{n}{n-k} = \binom{n}{k} \)

Read \( \binom{n}{k} \) as "\( n \) choose \( k \)"

The number of ways to select a group of 5 children from a class of 20 is "20 choose 5" = \( \binom{20}{5} = \frac{20!}{5! \,15!} = 15504 \)
Probability textbooks

How many ways are there to choose a subset of 3 from a set of 6 distinct books? By saying subset, we assume order doesn’t matter.

\[
\binom{6}{3} = \frac{6!}{3! \cdot 3!} = 20 \text{ ways}
\]
Combinations II
Summary of Combinatorics

Counting tasks on \( n \) objects

- **Sort objects** (permutations)
  - Distinct (distinguishable)
    - \( n! \)
  - Some distinct
    - \( \frac{n!}{n_1!n_2!\cdots n_r!} \)

- **Choose \( k \) objects** (combinations)
  - Distinct
    - 1 group
  - \( \binom{n}{k} \)

- **Put objects in \( r \) buckets**
  - \( r \) groups
General approach to combinations

The number of ways to choose $r$ groups of $n$ distinct objects such that

For all $i = 1, \ldots, r$, group $i$ has size $n_i$, and

\[ \sum_{i=1}^{r} n_i = n \] (all objects are assigned), is

\[ \frac{n!}{n_1! n_2! \cdots n_r!} \]

\( \binom{n}{n_1, n_2, \ldots, n_r} \)

Multinomial coefficient
Datacenters

13 different computers are to be allocated to 3 datacenters as shown in the table:

<table>
<thead>
<tr>
<th>Datacenter</th>
<th># machines</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>$n_A = 6$</td>
</tr>
<tr>
<td>B</td>
<td>$n_B = 4$</td>
</tr>
<tr>
<td>C</td>
<td>$n_C = 3$</td>
</tr>
</tbody>
</table>

How many different divisions are possible?

A. $\binom{13}{6,4,3} = 60,060$

B. $\binom{13}{6}(\binom{7}{4})(\binom{3}{3}) = 60,060$

C. $6 \cdot 1001 \cdot 10 = 60,060$

D. A and B

E. All of the above
## Datacenters

<td>A</td>
<td>6</td>
</tr>
<tr>
<td>B</td>
<td>4</td>
</tr>
<tr>
<td>C</td>
<td>3</td>
</tr>
</tbody>
</table>

How many different divisions are possible?

A. \( \binom{13}{6,4,3} = 60,060 \)

Strategy: Combinations into 3 groups

Group 1 (datacenter A): \( n_1 = 6 \)
Group 2 (datacenter B): \( n_2 = 4 \)
Group 3 (datacenter C): \( n_3 = 3 \)

\[
\# \text{divisions} = \frac{13!}{6!4!3!} = 60,060
\]
Datacenters

13 different computers are to be allocated to 3 datacenters as shown in the table:

How many different divisions are possible?

A. \( \binom{13}{6,4,3} = 60,060 \)

Strategy: Combinations into 3 groups

- Group 1 (datacenter A): \( n_1 = 6 \)
- Group 2 (datacenter B): \( n_2 = 4 \)
- Group 3 (datacenter C): \( n_3 = 3 \)

B. \( \binom{13}{6} \binom{7}{4} \binom{3}{3} = 60,060 \)

Strategy: Product rule with 3 steps

1. Choose 6 computers for A \( \binom{13}{6} \)
2. Choose 4 computers for B \( \binom{7}{4} \)
3. Choose 3 computers for C \( \binom{3}{3} \)

\[
\frac{13!}{6!7!} \cdot \frac{7!}{4!3!} \cdot \frac{3!}{3!0!} = \frac{13!}{6!4!3!} = \binom{13}{6,4,3}
\]
Datacenters

13 different computers are to be allocated to 3 datacenters as shown in the table:

How many different divisions are possible?

A. \( \binom{13}{6,4,3} = 60,060 \)

Strategy: Combinations into 3 groups

Group 1 (datacenter A): \( n_1 = 6 \)
Group 2 (datacenter B): \( n_2 = 4 \)
Group 3 (datacenter C): \( n_3 = 3 \)

B. \( \binom{13}{6} \binom{7}{4} \binom{3}{3} = 60,060 \)

Strategy: Product rule with 3 steps

1. Choose 6 computers for A \( \binom{13}{6} \)
2. Choose 4 computers for B \( \binom{7}{4} \)
3. Choose 3 computers for C \( \binom{3}{3} \)

Your approach will determine if you use binomial/multinomial coefficients or factorials.
Probability textbooks

1. How many ways are there to choose 3 books from a set of 6 distinct books?

\[ \binom{6}{3} = \frac{6!}{3!3!} = 20 \text{ ways} \]

2. Two are by the same author. What if we don’t want to choose both?

A. \( \binom{6}{3} - \binom{6}{2} = 5 \text{ ways} \)
B. \( \frac{6!}{3!3!2!} = 10 \)
C. \( 2 \cdot \binom{4}{2} + \binom{4}{3} = 16 \)
D. \( \binom{6}{3} - \binom{4}{1} = 16 \)
E. Both C and D
F. Something else
1. How many ways are there to choose 3 books from a set of 6 distinct books? \[ \binom{6}{3} = \frac{6!}{3!3!} = 20 \text{ ways} \]

2. Two are by the same author. What if we don’t want to choose both?

**Strategy 1: Sum Rule**

\[ \begin{align*}
\text{Partitions into three cases} & \quad \text{with two of six written by Woolf} \\
\checkmark & \quad \text{choose any two: } \binom{4}{2} \\
\times & \quad \text{choose any two: } \binom{4}{2} \\
\times & \quad \text{choose three: } \binom{4}{3} \\
\text{answer is: } 2\binom{4}{2} + \binom{4}{3} & = 16
\end{align*} \]
Probability textbooks

1. How many ways are there to choose 3 books from a set of 6 distinct books?

\[ \binom{6}{3} = \frac{6!}{3! \cdot 3!} = 20 \text{ ways} \]

2. Two are by the same author. What if we don’t want to choose both?

\[ \text{answer is } \binom{\frac{3}{2}}{3} - \binom{4}{3} = 16 \]

Strategy 2: "Forbidden method"

Choose \( k \) of \( n \) distinct objects \( \binom{n}{k} \)

Forbidden method: It is sometimes easier to exclude invalid cases than to account for all valid cases.
Buckets and The Divider Method
Summary of Combinatorics

Counting tasks on \( n \) objects

Servers and **indistinct** requests

How many ways are there to distribute $n$ **indistinct** web requests to $r$ servers?

**Goal**
Server 1 has $x_1$ requests,
Server 2 has $x_2$ requests,
...
Server $r$ has $x_r$ requests (the rest)
Bicycle helmet sales

How many ways can we assign $n = 5$ indistinct children to $r = 4$ distinct bicycle helmet styles?
Bicycle helmet sales

1 possible assignment outcome:

Goal Order \( n \) indistinct objects and \( r - 1 \) indistinct dividers.

Consider the following generative process...
The divider method: A generative proof

How many ways can we assign $n = 5$ indistinct children to $r = 4$ distinct bicycle helmet styles?

**Goal**  Order $n$ indistinct objects and $r - 1$ indistinct dividers.

**0.** Make objects and dividers distinct
The divider method: A generative proof

How many ways can we assign $n = 5$ indistinct children to $r = 4$ distinct bicycle helmet styles?

**Goal** Order $n$ indistinct objects and $r - 1$ indistinct dividers.

0. Make objects and dividers distinct

1. Order $n$ distinct objects and $r - 1$ distinct dividers

   $$(n + r - 1)!$$
The divider method: A generative proof

How many ways can we assign \( n = 5 \) indistinct children to \( r = 4 \) distinct bicycle helmet styles?

**Goal** Order \( n \) indistinct objects and \( r - 1 \) indistinct dividers.

0. Make objects and dividers distinct

1. Order \( n \) distinct objects and \( r - 1 \) distinct dividers

\[
(n + r - 1)!
\]

2. Make \( n \) objects indistinct

\[
\frac{1}{n!}
\]

Lisa Yan, Chris Piech, Mehran Sahami, and Jerry Cain, CS109, Spring 2024
The divider method: A generative proof

How many ways can we assign $n = 5$ indistinct children to $r = 4$ distinct bicycle helmet styles?

**Goal** Order $n$ indistinct objects and $r - 1$ indistinct dividers.

0. Make objects and dividers distinct

1. Order $n$ distinct objects and $r - 1$ distinct dividers

2. Make $n$ objects indistinct

3. Make $r - 1$ dividers indistinct

$$\frac{1}{n!} \cdot \frac{1}{(r - 1)!}$$
The divider method

The number of ways to distribute \( n \) indistinct objects into \( r \) buckets is equivalent to the number of ways to permute \( n + r - 1 \) objects such that \( n \) are indistinct objects, and \( r - 1 \) are indistinct dividers:

\[
\text{Total} = (n + r - 1)! \times \frac{1}{n!} \times \frac{1}{(r-1)!}
\]

\[
= \binom{n + r - 1}{r - 1} \text{ outcomes}
\]
You have $10 million to invest in 4 companies (in units of $1 million).

1. How many ways can you fully allocate your $10 million?
2. What if you want to invest at least $3 million in company 1?
3. What if you don’t have to invest all your money?
Venture capitalists. #1

You have $10 million to invest in 4 companies (in units of $1 million).

1. How many ways can you fully allocate your $10 million?

Set up

\[ x_1 + x_2 + x_3 + x_4 = 10 \]

\( x_i \): amount invested in company \( i \)

\[ x_i \geq 0 \]

\( x_i \) are integers

Solve

\[ \binom{n + r - 1}{r - 1} \]

\[ = \binom{10 + 4 - 1}{4 - 1} \]

\[ = \binom{13}{3} \]

\[ = 286 \]
You have $10 million to invest in 4 companies (in units of $1 million).

1. How many ways can you fully allocate your $10 million?

2. What if you want to invest at least $3 million in company 1?

Set up
\[ x_1 + x_2 + x_3 + x_4 = 10 \]

\( x_i \): amount invested in company \( i \)

Added constraint: $3M goes to company \( 1 \), but remaining $7M can be freely allocated.

So, we're really solving
\[ y_1 + y_2 + y_3 + y_4 = 7 \]

\[ y_1 \geq 0 \]
You have $10 million to invest in 4 companies (in units of $1 million).

1. How many ways can you fully allocate your $10 million?
2. What if you want to invest at least $3 million in company 1?
3. What if you don’t have to invest all your money?

Set up

\[ x_1 + x_2 + x_3 + x_4 \leq 10 \]

\( x_i \): amount invested in company \( i \)

\( x_i \geq 0 \)

We are really solving

\[ x_1 + x_2 + x_3 + x_4 + x_5 = 10 \]

where \( x_5 \) counts the money you elect to not invest

Solve

\[
\binom{n + r - 1}{r - 1}
\]

\[
\binom{10 + 5 - 1}{5 - 1} = \binom{14}{4} = 1001
\]
Summary of Combinatorics

Counting tasks on $n$ objects

- Sort objects (permutations)
  - Distinct (distinguishable)
  - Some distinct

- Choose $k$ objects (combinations)
  - Distinct
  - 1 group
  - $r$ groups

- Put objects in $r$ buckets
  - Distinct
  - Indistinct

- determine if objects are distinct
- use product rule if several steps
- use inclusion-exclusion if different cases
Combinatorial Proofs
Combinatorial Proofs

A combinatorial proof—sometimes called a story proof—is a proof that counts the same thing in two different ways, forgoing any tedious algebra.

Combinatorial proofs aren’t as formal as CS103 proofs, but they still need to convince the reader something is true in an absolute sense.

An algebraic proof of, say, \( \binom{n}{k} = \binom{n}{n-k} \) is straightforward if you just write combinations in terms of factorials.

A combinatorial proof makes an identity like \( \binom{n}{k} = \binom{n}{n-k} \) easier to believe and understand intuitively.

Combinatorial Proof:

Consider choosing a set of k CS109 CAs from a total of n applicants. We know that there are \( \binom{n}{k} \) such possibilities. Another way to choose the k CS109 CAs is to disqualify \( n - k \) applicants. There are \( \binom{n}{n-k} \) ways to choose which \( n - k \) don’t get the job. Specifying who is on CS109 course staff is the same as specifying who isn’t. That means that \( \binom{n}{k} \) and \( \binom{n}{n-k} \) must be counting the same thing.
Combinatorial Proofs

Let’s provide another combinatorial proof, this time proving that

\[ n\binom{n-1}{k-1} = k\binom{n}{k} \]

This is easy to prove algebraically (provided \(k\) and \(n\) are positive integers, with \(k \leq n\)). A combinatorial/story proof, however, is more compelling!

Combinatorial Proof:

Consider \(n\) candidates for college admission, where \(k\) candidates can be accepted, and precisely one of the \(k\) is selected for a full scholarship. We can first choose the lucky recipient of the full scholarship and then select an additional \(k - 1\) applicants from the remaining \(n - 1\) applicants to round out the set of admits. Or we can select which \(k\) applicants are accepted and then choose which of those \(k\) gets the full ride.
