Modern QA from text

- An idea originating from the IR community
- With massive collections of full-text documents, simply finding relevant documents is of limited use: we want answers from textbases
- QA: give the user a (short) answer to their question, perhaps supported by evidence.
- The common person’s view? [From a novel]
  - “I like the Internet. Really, I do. Any time I need a piece of shareware or I want to find out the weather in Bogota … I’m the first guy to get the modern humming. But as a source of information, it sucks. You got a billion pieces of data, struggling to be heard and seen and downloaded, and anything I want to know seems to get trampled underfoot in the crowd.”

Sample TREC questions

1. Who is the author of the book, "The Iron Lady: A Biography of Margaret Thatcher"?
2. What was the monetary value of the Nobel Peace Prize in 1989?
3. What does the Peugeot company manufacture?
4. How much did Mercury spend on advertising in 1993?
5. What is the name of the managing director of Apricot Computer?
6. Why did David Koresh ask the FBI for a word processor?
7. What debts did Qintex group leave?
8. What is the name of the rare neurological disease with symptoms such as: involuntary movements (tics), swearing, and incoherent vocalizations (grunts, shouts, etc.)?

People want to ask questions...

Examples from AltaVista query log (late 1990s)
- who invented surf music?
- how to make stink bombs
- where are the snowdens of yesteryear?
- which english translation of the bible is used in official catholic liturgies?
- how to do clayart
- how tall is the sears tower?

Examples from Excite query log (12/1999)
- how can i find someone in texas
- where can i find information on puritan religion?
- what are the 7 wonders of the world
- how can i eliminate stress
- What vacuum cleaner does Consumers Guide recommend

Around 10% of early query logs

A Brief (Academic) History

- Question answering is not a new research area
- Question answering systems can be found in many areas of NLP research, including:
  - Natural language database systems
  - A lot of early NLP work on these: e.g., LUNAR system
  - There’s still Microsoft English Query
  - Spoken dialog systems
  - Currently very active and commercially relevant

A Focusing on open-domain QA is new focus

- MURAX (Kupiec 1993): Encyclopedia answers
- Hirschman: Reading comprehension tests
- TREC QA competition: 1999–

- But not really new either: Simmons et al. 1965
  - Take an encyclopedia and load it onto a computer.
  - Take a question and parse it into a logical form
  - Perform simple information retrieval to get relevant texts, parse those into a logical form, match and rank
  - What do worms eat? Worms eat ???
    - Candidates
    - Worms eat grass
    - Grass is eaten by worms
    - Birds eat worms
Online QA Examples

- AnswerBus is an open-domain question answering system: [www.answerbus.com](http://www.answerbus.com)
- EasyAsk, AnswerLogic, AnswerFriend, Start, Quasm, Mulder, Webclopedia, ISI TextMap, etc.
- Google

Question Answering at TREC

- Question answering competition at TREC consists of answering a set of 500 fact-based questions, e.g., "When was Mozart born?".
- For the first three years systems were allowed to return 5 ranked answer snippets (50/250 bytes) to each question.
  - Mean Reciprocal Rank (MRR) scoring:
    - 1, 0.5, 0.33, 0.25, 0.2, 0 for 1, 2, 3, 4, 5, 6+ doc
  - Mainly Named Entity answers (person, place, date, …)
- From 2002 the systems are only allowed to return a single exact answer and the notion of confidence has been introduced.

The TREC Document Collection

- The current collection uses news articles from the following sources:
  - AP newswire, 1998-2000
  - Xinhua News Agency newswire, 1996-2000
- In total there are 1,033,461 documents in the collection. 3GB of text.
- This is a lot of text to process entirely using advanced NLP techniques so the systems usually consist of an initial information retrieval phase followed by more advanced processing.
- Many supplement this text with use of the web, and other knowledge bases

Top Performing Systems

- Currently the best performing systems at TREC can answer approximately 70% of the questions !!!
- Approaches and successes have varied a fair deal
  - Knowledge-rich approaches, using a vast array of NLP techniques have been most successful
    - Notably Harabagiu, Moldovan et al. - SMU/UTD/LCC
    - AskMSR system stressed how much could be achieved by very simple methods with enough text (and now various copycats)

AskMSR: Shallow approach

- In what year did Abraham Lincoln die?
- Ignore hard documents and find easy ones

AskMSR: Details

1. Question
2. Rewrite Query
3. Collect Summaries, Mine N-grams
4. Filter N-grams
5. N-Best Answers

AskMSR: In Paris France 59% museums hosts 10%
Query rewriting:
Ans is often similar to Ques

- Classify question into seven categories
  - Who
  - When
  - Where
  - What
  - Why
  - How
  - Is
- Category-specific transformation rules
  - For Where questions, move ‘is’ to all possible locations
    - "Where is the Louvre Museum located"
    - "the Louvre Museum located is"
    - "the Louvre Museum located is"
    - "the Louvre Museum located is"
    - "the Louvre Museum located is"
    - "the Louvre Museum located is"
- Expected answer "Datatype" (eg, Date, Person, Location, …)
  - When was the French Revolution?
    - DATE
- Hand-crafted classification/rewrite/datatype rules
  - (Could they be automatically learned?)

Mining N-Grams

- Send query to search engine; use result snippets
- Enumerate all N-grams in all retrieved snippets
  - Use hash table and other fancy footwork to make this efficient
- Weight of an n-gram: occurrence count, each weighted by ‘reliability’ (weight) of rewrite that fetched the document
- Example: "Who created the character of Scrooge?"
  - Dickens - 117
  - Christmas Carol - 78
  - Charles Dickens - 75
  - Disney - 72
  - Carl Banks - 54
  - A Christmas - 41
  - Christmas Carol - 45
  - Uncle - 33

Filtering N-Grams

- Each question type is associated with one or more “data-type filters” = regular expression
  - When...
  - Where...
  - What...
  - Who...
- Boost score of n-grams that do match regexp
- Lower score of n-grams that don’t match regexp
- Details omitted from paper....

Step 5: Tiling the Answers

Scores
20
15
10

Scores
20
15
10

merged, discard old n-grams
Score 45

Repeat, until no more overlap

Results

- Standard TREC contest test-bed: ~1M documents; 900 questions
- Technique doesn’t do so well (though would have placed in top 9 of ~30 participants!)
  - MRR = 0.262
    - Right answer ranked about #4-#5 on average
  - Why? Because it relies on the enormity of the Web!
- But using the Web as a whole, not just TREC’s 1M documents: MRR = 0.42
  - On average, right answer is ranked about #2-#3

Limitations

- In many scenarios (e.g., monitoring an individual’s email…) we only have a small set of documents
- Works best/only for “Trivial Pursuit”-style fact-based questions
- Limited/brittle repertoire of
  - question categories
  - answer data types/filters
  - query rewriting rules
Full NLP QA: LCC (Harabagiu/Moldovan)

Value from sophisticated NLP – Pasca and Harabagiu (2001)

- Good IR is needed: SMART paragraph retrieval
- Large taxonomy of question types and expected answer types is crucial
- Statistical parser used to parse questions and relevant text for answers, and to build KB
- Further value comes from deeper NLP and inferencing

Answer Types

- Of course, determining the answer type isn’t that easy...
  - Who questions can have organizations as answers
    - Who sells the most hybrid cars?
  - Which questions can have people as answers
    - Which president went to war with Mexico?

Lexical Terms Extraction as input to Information Retrieval

- Questions approximated by sets of unrelated words (lexical terms)
- Similar to bag-of-word IR models: but choose nominal non-stop words and verbs

<table>
<thead>
<tr>
<th>Question (from TREC QA track)</th>
<th>Lexical terms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q002: What was the monetary value of the Nobel Peace Prize in 1989?</td>
<td>monetary, value, Nobel, Peace, Prize, 1989</td>
</tr>
<tr>
<td>Q003: What does the Peugeot company manufacture?</td>
<td>Peugeot, company, manufacture</td>
</tr>
<tr>
<td>Q004: How much did Mercury spend on advertising in 1993?</td>
<td>Mercury, spend, advertising, 1993</td>
</tr>
</tbody>
</table>
Passage Extraction Loop

- **Passage Extraction Component**
  - Extracts passages that contain all selected keywords
  - Passage size dynamic
  - Start position dynamic

- **Passage quality and keyword adjustment**
  - In the first iteration use the first 6 keyword selection heuristics
  - If the number of passages is lower than a threshold ⇒ query is too strict ⇒ drop a keyword
  - If the number of passages is higher than a threshold ⇒ query is too relaxed ⇒ add a keyword

Passage Scoring

- Passage ordering is performed using a sort that involves three scores:
  - The number of words from the question that are recognized in the same sequence in the window
  - The number of words that separate the most distant keywords in the window
  - The number of unmatched keywords in the window

Rank candidate answers in retrieved passages

Q066: Name the first private citizen to fly in space.

- Answer type: Person
- Text passage:
  
  *Among them was Christa McAuliffe, the first private citizen to fly in space. Karen Allen, best known for her starring role in "Raiders of the Lost Ark", plays McAuliffe. Brian Kerwin is featured as shuttle pilot Mike Smith.*

- Best candidate answer: Christa McAuliffe

Extracting Answers for Factoid Questions: NER!

- In TREC 2003 the LCC QA system extracted 289 correct answers for factoid questions
- The Name Entity Recognizer was responsible for 234 of them
- Current QA is largely based on the high accuracy recognition of a large variety of Named Entity types

<table>
<thead>
<tr>
<th>NER Type</th>
<th>55</th>
<th>15</th>
<th>3</th>
</tr>
</thead>

Semantics and Reasoning for QA: Predicate-argument structure

Q336: When was Microsoft established?

- This question is difficult because Microsoft tends to establish lots of things...
  
  *Microsoft plans to establish manufacturing partnerships in Brazil and Mexico in May.*

- Need to be able to detect sentences in which 'Microsoft' is object of 'establish' or close synonym.

  Matching sentence:

  *Microsoft Corp was founded in the US in 1975, incorporated in 1981, and established in the UK in 1982.*

- Requires analysis of sentence syntax/semantics!

Semantics and Reasoning for QA: Syntax to Logical Forms

- Syntactic analysis plus semantic => logical form
- Mapping of question and potential answer LFs to find the best match
Abductive inference

- System attempts inference to justify an answer (often following lexical chains)
- Their inference is a kind of funny middle ground between logic and pattern matching
- But very effective: 30% improvement
- Q: When was the internal combustion engine invented?
  A: The first internal-combustion engine was built in 1867.
  invent → create, mentally → create → build

Question Answering Example

Q: How hot does the inside of an active volcano get?
A: \( \text{get(TEMPERATURE, inside(volcano(active)))} \)
  - lava fragments belched out of the mountain were as hot as 300 degrees Fahrenheit
  - fragments(lava, \( \text{TEMPERATURE}(\text{degrees}(300)) \), belched(out, mountain))
  - volcano is a mountain
  - lava is PARTOF volcano
  - lava inside volcano
  - fragments of lava HAVE PROPERTIES OF lava

The needed semantic information is in WordNet definitions, and was successfully translated into a form that was used for rough ‘proofs’

Answer Validation motivates the Robust Textual Inference Task

- The task: Can systems correctly perform ‘local textual inferences’ [individual inference steps]?
- On the assumption that some piece of text (T) is true, does this imply the truth of some other hypothesis text (H)?
  - Sydney was the host city of the 2000 Olympics \( \rightarrow \) The Olympics have been held in Sydney \( \text{TRUE} \)
- The format could be used for evaluating extended inferential chains or knowledge
  - But, in practice, fairly direct stuff

The textual inference task

- Does text \( T \) justify an inference to hypothesis \( H \)?
  - Emphasis on variability of linguistic expression
  - Robust, accurate textual inference would enable:
    - Semantic search: \( H: \) lobbyists attempting to bribe U.S. legislators
    - T: The A.P. named two more senators who received contributions engineered by lobbyist Jack Abramoff in return for political favors
    - Question answering: \( H: \) Who bought J.D. Edwards?
      - T: Thanks to its recent acquisition of J.D. Edwards, Oracle will soon be able...
    - Customer email response
    - Relation extraction (database building)
    - Document summarization

Natural Examples: Reading Comprehension

(CNN Student News) -- January 24, 2006
Answer the following questions about today’s featured news stories. Write your answers in the space provided.

1. Where is the country of Somalia located? What ocean borders this country?
2. Why did crew members from the USS Winston S. Churchill recently stop a small vessel off the coast of Somalia? What action did the crew of the Churchill take?

Verification of terms [Dan Roth]

- Non-disclosure Agreement
- Answer the following questions about today’s featured news stories. Write your answers in the space provided.
  - 1. Where is the country of Somalia located? What ocean borders this country?
  - 2. Why did crew members from the USS Winston S. Churchill recently stop a small vessel off the coast of Somalia? What action did the crew of the Churchill take?
- Conditions I care about:
  - All information discussed is freely shareable unless other party indicates in advance that it is confidential
  - TRUE? FALSE?
Stanford system three-stage architecture [MacCartney et al. 2006]

1. Linguistic analysis
2. Graph alignment
3. Features & classification

T: India buys missiles.
H: India acquires arms.

Why we need sloppy matching (i.e., almost IR-style techniques)

- Passage: Today’s best estimate of giant panda numbers in the wild is about 1,100 individuals living in up to 32 separate populations mostly in China’s Sichuan Province, but also in Shaanxi and Gansu provinces.
- Hypothesis 1: There are 32 pandas in the wild in China. (FALSE)
- Hypothesis 2: There are about 1,100 pandas in the wild in China. (TRUE)
- We’d like to get this right, but we just don’t have the technology to fully infer from best estimate of giant panda numbers in the wild is about 1,100 to there are about 1,100 pandas in the wild.
  - But with a little bit more than IR, we could do it.

Problem: graph embedding isn’t sufficient

- To be tractable, alignment scoring must be local
- But valid inference can hinge on non-local factors:
  - T1: The army acknowledged that interrogators had desecrated the Koran. H: Interrogators desecrated the Koran. (FALSE)
  - T2: Newsweek retracted its report that the army had acknowledged that interrogators had desecrated the Koran. H: Interrogators desecrated the Koran.

Features of valid inferences

- After alignment, extract features of inference
- Look for global characteristics of valid and invalid inferences
- Features embody crude semantic theories
- Feature categories: adjuncts, modals, quantifiers, implicatives, antonymy, tenses, structure, explicit numbers & dates
- Alignment score is also an important feature
- Extracted features ⇒ statistical model ⇒ score
  - Can learn feature weights using logistic regression
  - Or, can use hand-tuned weights
  - (Score ≥ threshold)? ⇒ prediction: yes/no
  - Threshold can be tuned

Structural (mis-)match features

T: Ahmadinejad attacked the “threat” to bring the issue of Iran’s nuclear activity to the UN Security Council by the US, France, Britain and Germany.
H: Ahmadinejad attacked the UN Security Council. (FALSE)

We check particularly the main predicate of the hypothesis and its match in the text to try and assess compatibility using syntactic grammatical relations:
- Object of attack in hypothesis is not related to object of attack in text
Factives & other implicatives

T: Libya has tried, with limited success, to develop its own indigenous missile, and to extend the range of its aging SCUD force for many years under the Al Fatah and other missile programs.

H: Libya has developed its own domestic missile program. (FALSE)

T: Scientists have discovered that drinking tea protects against heart disease by improving the function of the artery walls.

H: Tea protects from some disease. (TRUE)

- Evaluate governing verbs for implicativity
  - Unknown: say, tell, suspect, try, ...
  - Fact: know, wonderful, ...
  - True: manage to, ...
  - False: doubtful, misbelieve, ...

- Need to check for negative context

Restrictive adjuncts

- We can check whether adding/dropping restrictive adjuncts is licensed relative to upward and downward entailing contexts
  - In all, Zerich bought $422 million worth of oil from Iraq, according to the Volcker committee
    - Zerich bought oil from Iraq during the embargo
  - Zerich didn’t buy any oil from Iraq, according to the Volcker committee
    - Zerich didn’t buy oil from Iraq during the embargo

QA beyond TREC

- Answers to complex questions that require a longer answer
  - What is a PIC Freeze?
  - Can I travel with Ameripass in Mexico?

- Soricut and Brill 2006
  - Use the web (real FAQ websites)

- Otterbacher et al. 2005
  - Random walk model similar to PageRank

- Daume and Marcu 2006
  - Formal model for query expansion

Not all problems are solved yet!

- Where do lobsters like to live?
  - on a Canadian airline

- Where are zebras most likely found?
  - near dumps
  - in the dictionary

- Why can’t ostriches fly?
  - Because of American economic sanctions

- What’s the population of Mexico?
  - Three

- What can trigger an allergic reaction?
  - ...something that can trigger an allergic reaction

References

H. Daume and D. Marcu. Bayesian Query-Focused Summarization. ACL 2006
