CS224n Final Project Milestone

The written milestone is only for groups doing the choose-your-own final project. If you are doing the default final project, you just have to train the baseline model on SQuAD and submit it to the leaderboard (see the webpage for details). For the milestone, you need to

- Have collected all your data.
- Have implemented a (very simple) baseline.
- Have your evaluation pipeline set up.
- Have run your baseline over your data and evaluated its performance.

Please submit one milestone per team (any member of your team can submit) to Gradescope by **11:59pm on Februrary 28th**. You can **not** use late days for the project milestone. Your milestone can be short (a single page). It should, at minimum, have the following headings. If you have done more than run a baseline, good job! You are free to add more details to the milestone if you want.

Team: List the members of your team (names and SUIDs)

Mentor: List your mentor.

Problem Description: What is the problem you are investigating?

Data: What dataset are you using? How did you collect it?

Baseline: What is your baseline algorithm? It can be extremely simple (e.g., a bag-of-vectors model, a scikit-learn naive bayes classifier, a unigram or bigram language model). If you are unsure of what baseline to implement, please contact your project mentor.

Evaluation Methodology: How are you evaluating your baseline?

Results: How well does your baseline work?
