

Thinking Recursively

Part IV

Outline for Today

- ***Recap From Last Time***
 - Where are we, again?
- ***Enumerating Combinations***
 - Addressing some points from last time.
- ***Shrinkable Words***
 - A little word puzzle!

Recap from Last Time

List all *subsets* of
 $\{A, H, I\}$

Each decision is of the form
"do I pick
this element?"

List all *permutations* of
{A, H, I}

Each decision is of the form "what do I
pick next?"

Base Case: No decisions remain.

```
void exploreRec(decisions remaining,  
               decisions already made) {
```

```
  if (no decisions remain) {  
    process decisions made;  
  } else {  
    for (each possible next choice) {  
      exploreRec(all remaining decisions,  
                decisions made + that choice);  
    }  
  }  
}
```

Decisions yet to be made

Decisions already made

Recursive Case:
Try all options for the next decision.

```
void exploreAllTheThings(initial state) {  
  exploreRec(initial state, no decisions made);  
}
```

New Stuff!

Enumerating Combinations

You need at least five US Supreme Court justices to agree to set a precedent.

What are all the ways you can pick five justices off the US Supreme Court?

Generating Combinations

- Suppose that we want to find every way to choose exactly *one* element from a set.
- We could do something like this:

```
for (int x: mySet) {  
    cout << x << endl;  
}
```

Generating Combinations

- Suppose that we want to find every way to choose exactly *two* elements from a set.
- We could do something like this:

```
for (int x: mySet) {  
    for (int y: mySet) {  
        if (x != y) {  
            cout << x << ", " << y << endl;  
        }  
    }  
}
```

Generating Combinations

- Suppose that we want to find every way to choose exactly *three* elements from a set.
- We could do something like this:

```
for (int x: mySet) {  
    for (int y: mySet) {  
        for (int z: mySet) {  
            if (x != y && x != z && y != z) {  
                cout << x << ", " << y << ", " << z << endl;  
            }  
        }  
    }  
}
```

Generating Combinations

- If we know how many elements we want in advance, we can always just nest a whole bunch of loops.
- But what if we don't know in advance?
- Or we *do* know in advance, but it's a large number and we don't want to type until our fingers bleed?

Generating Combinations

One way to choose
5 elements out of **9**
is to include the first
element, then choose
4 elements out of
the remaining **8**.

Option 2:
Include this
person.

Our Return Type

- Each combination of k strings can be represented as a `HashSet<string>`.
- We want to return a container holding all possible combinations. That would be a `HashSet<HashSet<string>>`.
- It's not that unusual to see containers nested this way!

Our Base Case

Pick 0 more Justices out of
{Kagan, Breyer}

Chosen so far:
{Ginsburg, Roberts, Gorsuch,
Thomas, Sotomayor}

There's no need to
keep looking.

What should we
return in this case?

Our Base Case, Part II

Pick 5 more Justices out of
{Sotomayor, Thomas}

Chosen so far: { }

There is no way
to do this!

What should we
return in this
case?

Getting a Majority

Pick 5 Justices out of
{Kagan, Breyer, ..., Roberts}
Chosen so far: { }

Include
Elena Kagan

Pick 4 Justices out of
{ Breyer, ..., Roberts }
Chosen so far: { Kagan }

Exclude
Elena Kagan

Pick 5 Justices out of
{ Breyer, ..., Roberts }
Chosen so far: { }

The Wonderful **auto** Keyword

- There are many cases in which there is exactly one possible type that a variable could have.
- In that case, rather than explicitly writing out the type, you can use the **auto** keyword:

auto *var* = *expression*;

- Don't go crazy with this one; use it mostly to save typing when working with container types.

Base Case: No decisions remain.

Decisions yet to be made

```
Container exploreRec(decisions remaining,  
                    decisions already made) {
```

```
  if (no decisions remain) {  
    return container of decisions made  
  } else {
```

```
    Container result;
```

```
    for (each possible next choice) {
```

```
      result += exploreRec(all remaining decisions,  
                          decisions made + that choice);
```

```
    }
```

```
    return result;
```

```
  }
```

```
}
```

Recursive Case:

Try all options for the next decision.

Decisions already made

```
Container exploreAllTheThings(initial state) {  
  return exploreRec(initial state, no decisions made);  
}
```

A Little Word Puzzle

“What nine-letter word can be reduced to a single-letter word one letter at a time by removing letters, leaving it a legal word at each step?”

The Startling Truth?

S	T	A	R	T	L	I	N	G
---	---	---	---	---	---	---	---	---

The Startling Truth?

Shrinkable Words

- A ***shrinkable word*** is a word that can be reduced down to one letter by removing one character at a time, leaving a word at each step.
- ***Base Cases:***
 - A string that is not a word is not a shrinkable word.
 - Any single-letter word is shrinkable (A, I, and O).
- ***Recursive Step:***
 - A multi-letter word is shrinkable if you can remove a letter to form a shrinkable word.
 - A multi-letter word is not shrinkable if no matter what letter you remove, it's not shrinkable.

Our Solution, In Action

The Incredible Shrinking Word

Your Action Items

- ***Read Chapter 9 of the textbook.***
 - There's tons of cool backtracking examples there, and it will help you prep for Friday.
- ***Keep working on Assignment 3.***
 - If you're following our timetable, you should be done with all parts except Shift Scheduling.
 - Ask for help if you need it! That's what we're all here for.

Next Time

- ***Output Parameters***
 - Recovering the solution to a backtracking problem.
- ***More Backtracking***
 - Techniques in searching for feasibility.
- ***Closing Thoughts on Recursion***
 - It'll come back, but we're going to focus on other things for a while!
