It is our happy job to announce that this quarter we are going to host the sixth Stanford CS109 Probability for Computer Scientists Contest. This contest is meant to give you space to have fun with the material, to be inspired, and to be inspiring. This contest is open to all students in CS109 this quarter.

For the contest, create a probability driven project of your choosing that highlights concepts from the class and does something interesting. Each of you is eligible to submit one entry for the contest, where an entry consists of a screen capture and a short write-up of the probability theory behind your work. An optional proposal form will be due **Saturday, May 23 at 11:59 PM Pacific Time** (late proposals accepted until Wednesday, May 27 at 11:59 PM Pacific Time). The final contest entries will be due **Monday, June 8 at 11:59 PM Pacific Time**. We will release the results as soon as possible.

**Evaluation Criteria**
The entries will be evaluated by the CS109 staff on the following dimensions:

- **Creativity.** We are looking for original ideas that showcase unique thought. This dimension will be reflected in how novel your work is. Similarly, we encourage work that is aesthetically interesting.
- **Impact.** We will give special consideration to work that seems to have the potential for positive social benefit.
- **Academic Sophistication.** This dimension is based on the difficulty of the underlying probability, how well the ideas relate to the concepts presented in CS109 and how well you are able to articulate your ideas. More rules before.

An entry does not have to be strong in all dimensions of evaluation. For example, a submission that is an expression of a truly creative idea would be well received, even if it does not use the hardest concepts from CS109 and doesn’t have much social benefit.

**Prizes**
There will be one grand prize. If you win a grand prize you will get the highest honors of a gift card of unknown denomination to a local business of your choice that offers digital giftcards (or, if unavailable, to Amazon). In addition, we will award two finalists with gift cards of smaller denomination. We will reward all other serious contest entries with runner-up prizes, based on the amount of effort that was included, and the extent to which the work demonstrates understanding of the CS109 material.
Grading
From the Administrivia handout, remember that passing work on every assignment and quiz (i.e., doing the minimum) is necessary but not sufficient to obtain a Satisfactory grade (‘S’). At minimum, a satisfactory contest submission will (1) waive one “passing work” required component of the class (e.g., a quiz or an assignment), (2) add 6% to your overall course grade, and (3) build your experience with probability! At maximum, submissions can waive multiple “passing work” requirements, improve your course grade, and kickstart your career as a CS109 rockstar. :-)

We will appreciate all of your efforts—I realize that many of you are busy, and my intention is not to create insurmountable barriers to learning probability this quarter. We’ll provide some feedback and advice on your initial ideas through an optional proposal submission (to be discussed next).

Optional proposal
We’d like to help you succeed in your endeavors and carve out a contest plan that will work for you this quarter! You will have the option to submit a really short proposal (e.g., topic, initial plans) on which we can give feedback. This is completely optional, and you can definitely submit a final contest submission without sending in a proposal. But to encourage you to plan ahead, we will be adding a small boost to your overall grade if you submit a proposal and a completed contest submission. You will not get this boost if you do not actually do the contest.

You can submit your project idea(s) to Gradescope under “[Optional Contest] – Proposal Submission.” We will review all proposals submitted by Saturday, May 23 at 11:59 PM Pacific Time and get 0.5% course grade bonus. Late proposals submitted by Wednesday, May 27 at 11:59 PM Pacific Time will get 0.3% course grade bonus. Again, proposal bonuses are awarded only if you also turn in a final contest submission by Monday, June 8 at 11:59 PM Pacific Time.

Final Submission Format
Your submission will have two parts: (1) a demonstration video and (2) a short write-up. This is the minimum needed to explain what is cool and probabilistic about your submission.

The demonstration video could just be a screen capture that shows your program running. The idea behind this submission format is to allow you to use any programming language without having to worry about your program running on our machines. The write-up does not have to be formatted in any particular way. It is another medium for you to explain to us why your submission is interesting. You should include a probabilistic explanation of your program.

Use the two submission parts in anyway you like. If your idea is best expressed via a write-up, submit a short and sweet video. If your entry is best expressed via a video, keep your write-up minimal.

Final Submission Instructions
All entries must be submitted electronically.

1. Upload your video to Youtube.
2. Insert a link to your video at or near the top of your write-up, and submit your write-up as a PDF on Gradescope under “[Optional Contest] – Written Report with YouTube Link.”
3. Submit your code on Gradescope under “[Optional Contest] – All Code.”
Official Contest Rules
1. Entries to this contest are beholden to the Stanford Honor Code.
2. Only students registered in CS109 are eligible to submit entries in the contest. Only one entry per person will be accepted.
3. No groups are allowed. Individual work only.
4. You can code your submission in any programming language.
5. Your submission must be sent by 11:59 PM Pacific Time on Monday, June 8. Late entries will not be accepted, and you cannot use late days for the contest.
6. You may ask Lisa or the TAs for help during office hours; however, they will give priority to students working on problem sets.
7. You are free to use any of the probability ideas we have gone over in class.
8. If you use a concept we didn’t cover, the concept should be close enough to the material that you could explain it in terms of concepts we have learned in CS109.
9. This should not be a project you have made for a grade in another class.
10. To keep things fair, we are not going to allow students to use deep learning libraries (e.g. TensorFlow, PyTorch, etc.).

Ideas
This is a short list of ideas. We want to neither limit nor constrain your thinking. Our prior belief is that people could make some sort of artistic program (think the Monument to Change as it Changes art installation in front of CEMEX). Students could recreate a probabilistic program such as Shazam, perhaps with their own twist. Students could work through a hard proof. Students could implement a randomized algorithm, like Monte Carlo Tree Search. An entry could posit a probabilistic model for something in the real world, simulate it and analyze the resulting distributions. You could even make a program that visualizes a probability phenomena. Hopefully these ideas pale in comparison to what you have in mind.

You can submit a machine learning project, but an entry that simply uses a black box algorithm won’t be considered particularly creative.

Here are some winning submissions from previous quarters of CS109 to give you a sense of what is possible:

- Recidivism Risk: Algorithmic Prediction and Racial Bias
- A Better Way to Reform the Electoral College
- On the Verge: Modeling Species Extinctions using the Galton-Watson Branching Process
- Shut the Box
- Monte Carlo Tree Search for Tic Tac Toe

Don’t be intimidated. Everyone is welcome. Go learn and create!
