

# CS109 Lecture 28 Worksheet: Final Review

A Slide-by-Slide Index into Ten Past Final Exams

Summer 2026

## Lecture 28 Worksheet: Final Review

**Topics:** every concept on the Lecture 28 review deck, cross-referenced against every final exam posted on the [CS109 final exam page](#).

**How to use this sheet.** This worksheet is not a problem set; it is a *map*. Walk through the review slides in order. Whenever a slide covers something you are shaky on, come here, find the slide number, and go work the listed exam problems. Each entry names the exam, the problem number and title, and the specific parts that exercise that slide’s idea. The abbreviations (Spr26, Win26, F24, ...) are expanded with download links in the **Exam Index** at the end of this document.

**A note on coverage.** A concept that appears on nine of the ten finals is a concept you will see again. Rows below with long lists are the highest-yield material on the sheet. Rows with one or two entries are still fair game, but budget your time accordingly.

---

### Block 1: Core Probability (slides 4–15)

| Slides | Concept                                                                               | Final exam problems                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4–8    | Axioms, $P(E \cup F)$ , inclusion–exclusion, complement, De Morgan’s laws, chain rule | F22 #1 Short Answer (c); F24 #2 Airline Flights (a, b); Win26 #1 Let’s Get This Party Started (d); Spr17 #2 Letters of Recommendation (a, b); W22 #1 Short Answer (d)                                                                          |
| 9      | Law of Total Probability                                                              | Win25 #1 Short Answer (c); Win26 #2 Powering a Town (a); Win25 #3 Bag of Coins (b); F23 #3 Popcorn (c); Spr17 #2 Letters of Recommendation (c)                                                                                                 |
| 10–11  | Conditional probability; Bayes’ Theorem                                               | <b>Spr26 #2 Fraud Detection (a, b)</b> ; Win25 #1 Short Answer (b); Win26 #2 Powering a Town (b); F24 #2 Airline Flights (c); W22 #2 Quantitative Art History (b); F17 #1 Missing Not at Random (b, c); Spr17 #2 Letters of Recommendation (d) |
| 12–14  | Independence; independence $\neq$ mutual exclusion                                    | <b>F23 #1 Short Answer (c)</b> (how to <i>test</i> for each from probabilities alone); F21 #1 True or False (a); Win26 #1 Let’s Get This Party Started (c); F22 #1 Short Answer (c); F17 #1 Missing Not at Random (e)                          |
| 15     | Conditional independence                                                              | <b>Spr26 #2 Fraud Detection (b)</b> ; Win26 #4 Are We Cooked? (a); F22 #2 Machine Learning (b, Naive Bayes); Spr17 #9 Multiclass Bayes                                                                                                         |

## Block 2: Random Variables (slides 17–37)

| Slides | Concept                                                                 | Final exam problems                                                                                                                                            |
|--------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17–21  | PMF vs. PDF; expectation and variance; distributions sum/integrate to 1 | Win26 #6 That's Private (a); F21 #6 P-Hacking (b); F23 #4 Delicate Polling (b); Spr17 #7 Differential Privacy (a, b); W22 #1 Short Answer (a)                  |
| 22–24  | Computing $P(X = x)$ : discrete vs. continuous                          | Win26 #3 Let's Tree Max (a); Win25 #2 In-Vitro Fertilization (b); F24 #3 Board Games (a, b); Spr26 #3 Support Chat Requests (b)                                |
| 25–30  | Computing $P(X \leq x)$ : summing a PMF vs. using a CDF                 | Win25 #1 Short Answer (a); F23 #1 Short Answer (a); F24 #1 Short Answer (a); W22 #1 Short Answer (b)                                                           |
| 31–37  | Computing $P(X \geq x)$ : continuous CDFs and tail probabilities        | <b>Spr26 #1 Short Answer (a)</b> ; F23 #3 Popcorn (a) (Normal CDF, conditional); F23 #5 Water Levels (a); F21 #2 Algorithmic Art (a); F17 #2 Occupy Mt Gox (a) |

## Block 3: Common Distributions (slides 39–55)

| Slides    | Concept                                                                        | Final exam problems                                                                                                                                                                                                                                       |
|-----------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 39        | Binomial: fixed $n$ , independent trials, constant $p$                         | Win25 #2 In-Vitro Fertilization (b); Win25 #3 Bag of Coins (a, b); F23 #2 Don't Quit Until You Are Ahead (a); F24 #7 Sorted Random Values (a); Win26 #3 Let's Tree Max (a); W22 #4 Bayesian Carbon Dating (b)                                             |
| 40–45     | Approximating a Binomial with a Poisson or a Normal                            | Win26 #3 Let's Tree Max (b); F23 #2 Don't Quit Until You Are Ahead (b); F21 #3 How Lucky! (b); Spr17 #3 Hindenbug (a, c)                                                                                                                                  |
| 46        | Continuity correction                                                          | Spr17 #3 Hindenbug (c); F23 #2 Don't Quit Until You Are Ahead (b)                                                                                                                                                                                         |
| 47–48, 54 | Geometric and Negative Binomial: trials until success                          | <b>Win26 #1 Let's Get This Party Started (a)</b> ; W22 #1 Short Answer (b); F24 #8 MLE of Negative Binomial (a); F21 #3 How Lucky! (a); F23 #2 Don't Quit Until You Are Ahead (c)                                                                         |
| 49–50     | Choosing the right distribution from the problem's conditions; the Multinomial | <b>Win26 #1 Let's Get This Party Started (a–d)</b> (a different distribution in each part); Win25 #1 Short Answer (d, multinomial); W22 #6 Rank Ordering of Samples (a, b, multinomial); F23 #3 Popcorn (b) (Binomial of Normals); F24 #3 Board Games (a) |
| 51–53     | Poisson vs. Exponential: counts in an interval vs. time until next event       | <b>Spr26 #3 Support Chat Requests (a, b, c)</b> ; Win26 #1 Let's Get This Party Started (b); F23 #1 Short Answer (f); F21 #1 True or False (e); Spr26 #5 Hidden Chambers (a); F24 #6 Hidden Chambers (a); Spr17 #3 Hindenbug (a, b)                       |
| 55        | Uniform (discrete and continuous)                                              | Win25 #4 Microcontroller Precision Error (a); Win25 #5 Exponential Backoff (a); F24 #7 Sorted Random Values (a, b); F17 #5 Expected Maximum Uniform                                                                                                       |

## Block 4: Inference (slides 56–60)

| Slides | Concept                                                                           | Final exam problems                                                                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 56–57  | Recognizing an inference problem: prior, observation, likelihood, update          | Win25 #3 Bag of Coins (c); F21 #5 Chess.com Puzzles; W22 #2 Quantitative Art History (b)                                                                                                                                                                                                                    |
| 58–60  | Bayesian updating over a discrete or continuous prior (the carbon-dating pattern) | <b>W22 #4 Bayesian Carbon Dating (c, d)</b> (this is the slides' worked example); <b>Spr26 #5 Hidden Chambers in the Pyramid of the Sun (b)</b> ; F24 #6 Hidden Chambers in the Great Pyramid (b); Win26 #4 Are We Cooked? (b); F23 #7 Estimating Child Vocab Size (b); F17 #1 Missing Not at Random (c, d) |

## Block 5: Probabilistic Models and Joint Distributions (slides 61–70)

| Slides | Concept                                                              | Final exam problems                                                                                                 |
|--------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 61–65  | Random variables varying together; conditional distributions         | Win25 #6 Indus Valley Script (b); F21 #4 Probabilistic Supply Chains (b); F24 #5 What Name Doesn't Give Away Age?   |
| 66–70  | Joint distributions; how to represent them (tables, functions, code) | <b>F21 #4 Probabilistic Supply Chains (a, b, c, d)</b> ; Win26 #4 Are We Cooked? (a); Spr17 #5 Gaussian Blur (a, b) |

## Block 6: The Beta Distribution (slides 72–79)

| Slides | Concept                                                             | Final exam problems                                                                                                                                                                                                               |
|--------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 72–73  | A distribution beats a point estimate; Laplace / prior counts       | F22 #2 Machine Learning (b); F23 #1 Short Answer (e); F21 #7 Calibration of ML Algorithms (b)                                                                                                                                     |
| 74–77  | Beta as a distribution over a probability; $E[X]$ , $\text{Var}(X)$ | W22 #3 Beta $\pm$ ; F21 #2 Algorithmic Art (c); F17 #4 Learning While Helping (a, b, d)                                                                                                                                           |
| 78–79  | Inference with Beta: posterior = Beta( $a$ +successes, $b$ +fails)  | <b>Spr26 #7 Testing a New Medicine (a, b)</b> ; <b>Win26 #5 Two LLMs Walk Into A Bar (a, b)</b> ; Win25 #8 Bayesian RNA Sequencing (b, c); F22 #5 Better; F24 #7 Sorted Random Values (b, c); F17 #4 Learning While Helping (a–d) |

## Block 7: Adding Random Variables and the CLT (slides 81–93)

| Slides | Concept                                                      | Final exam problems                                                                                        |
|--------|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| 81–83  | IID: independent and identically distributed                 | F21 #1 True or False (d); F23 #1 Short Answer (d); Win25 #4 Microcontroller Precision Error (b)            |
| 84–89  | Sums of random variables; rules for common sums; convolution | F22 #3 Night Sight (b); Spr17 #4 NBA Finals Week (b); F17 #3 Timing Attack (b, c); F23 #1 Short Answer (b) |

| Slides | Concept                           | Final exam problems                                                                                                                                                                                                                                       |
|--------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 90–93  | Central Limit Theorem in practice | <b>Spr26 #4 Warehouse Shipping (a, b); Win26 #2 Powering a Town (c, d);</b> Win26 #6 That's Private (b); Win25 #4 Microcontroller Precision Error (b); F22 #1 Short Answer (a); F21 #6 P-Hacking (c, d); F17 #2 Occupy Mt Gox (b); Spr17 #3 Hindenbug (c) |

## Block 8: Sampling, Sample Mean, and Standard Error (slides 95–101)

| Slides  | Concept                                                            | Final exam problems                                                                                                                                |
|---------|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 95–96   | Why we sample; population vs. sample; with vs. without replacement | <b>Win26 #9 Genomics and Sampling (c);</b> Win25 #7 Estimating Course Size (a); F23 #4 Delicate Polling (c)                                        |
| 97–99   | Sample mean and standard error                                     | <b>W22 #1 Short Answer (c);</b> Win26 #6 That's Private (b); F22 #3 Night Sight (b); Win25 #7 Estimating Course Size (a); F21 #1 True or False (d) |
| 100–101 | Sample variance (the $n - 1$ correction)                           | Win25 #7 Estimating Course Size (b); Spr17 #6 Improved Exam Grading (a)                                                                            |

## Block 9: Bootstrapping, Hypothesis Testing, and p-values (slides 103–107)

| Slides  | Concept                                                                              | Final exam problems                                                                                                                                                                                               |
|---------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103–104 | What bootstrapping assumes; bootstrapping as code (resample <b>with</b> replacement) | <b>Spr26 #8 Debugging a Bootstrap</b> (find the three bugs); Win25 #7 Estimating Course Size (c); Win26 #9 Genomics and Sampling (b, c); F21 #1 True or False (c); F22 #6 B-Reel (d); F23 #4 Delicate Polling (c) |
| 105–107 | Hypothesis testing and p-values under the null                                       | <b>F24 #4 Song of the Quarter (c);</b> F21 #6 P-Hacking (e, f, g); Spr17 #6 Improved Exam Grading (b); F17 #4 Learning While Helping (e)                                                                          |

## Block 10: Algorithm Analysis and Expectation 2.0 (slides 109–114)

| Slides  | Concept                                                          | Final exam problems                                                                                                                                                 |
|---------|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 109–111 | Expectation of a sum = sum of expectations (indicator variables) | <b>Win26 #3 Let's Tree Max (c)</b> (expected empty zones); F22 #8 Approximate Counting Algorithm; F17 #5 Expected Maximum Uniform; Win25 #5 Exponential Backoff (b) |
| 112     | Conditional expectation $E[X \mid Y = y]$                        | F21 #4 Probabilistic Supply Chains (b); Win26 #10 The Doctor Will See You Now (a, b)                                                                                |
| 113–114 | Law of Total Expectation                                         | <b>Spr26 #1 Short Answer (c)</b> (drone deliveries by weather); <b>F24 #1 Short Answer (c)</b> (server crashes by age); F21 #4 Probabilistic Supply Chains (d)      |

## Block 11: Information Theory (slides 116–119)

| Slides  | Concept                                                 | Final exam problems                                                                                                                                 |
|---------|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 116–117 | Entropy as expected surprise; computing $H(X)$ in bits  | <b>Spr26 #9 Decision Tree Entropy (a)</b> ; Win25 #6 Indus Valley Script (a); F24 #5 What Name Doesn't Give Away Age?; Win26 #7 Playing it Safe (a) |
| 118–119 | Expected entropy after an observation; information gain | <b>Spr26 #9 Decision Tree Entropy (b, c)</b> ; Win25 #6 Indus Valley Script (c); Win26 #7 Playing it Safe (a, b)                                    |

## Block 12: Maximum Likelihood Estimation (slides 121–130)

| Slides       | Concept                                                                                             | Final exam problems                                                                                                                                                                                                                                            |
|--------------|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 121–126      | The modeling workflow: pick a model, fit parameters, predict                                        | F22 #2 Machine Learning (a); Win25 #10 Logistic Regression Conceptual (b); Win26 #10 The Doctor Will See You Now (c)                                                                                                                                           |
| 127–128, 130 | MLE: choose $\theta$ to maximize $P(\text{data} \mid \theta)$ ; log-likelihood; set derivative to 0 | <b>Win25 #9 MLE of a Truncated Normal Distribution; F24 #8 MLE of Negative Binomial (b)</b> ; F23 #5 Water Levels (b); F22 #7 Code Survival; W22 #5 Reliability Engineering; Spr17 #8 Windfarm Modeling; F17 #2 Occupy Mt Gox (c, d); F21 #1 True or False (b) |
| 129          | Gradient ascent (when there is no closed form)                                                      | <b>Win26 #8 It's Gamma Time</b> ; F23 #6 Logistic Regression Priors (c); F21 #2 Algorithmic Art (d)                                                                                                                                                            |

## Block 13: Logistic Regression (slides 131–138)

| Slides  | Concept                                                                                        | Final exam problems                                                                                                                                                                                                                                         |
|---------|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 131     | The logistic regression assumption<br>$P(Y = 1 \mid \mathbf{x}) = \sigma(\theta^T \mathbf{x})$ | Win25 #10 Logistic Regression Conceptual (a, b, c); F22 #2 Machine Learning (a, c); Win26 #9 Genomics and Sampling (a)                                                                                                                                      |
| 132–135 | Training: log-likelihood, partial derivatives, gradient ascent update                          | <b>Spr26 #6 Logistic Regression (b)</b> ; F23 #6 Logistic Regression Priors (b, c, MAP version); Win25 #10 Logistic Regression Conceptual (d); Spr17 #10 Logistic Vision Test; F17 #7 The Most Important Features (a, b, c); W22 #7 Machine Teaching (b, c) |
| 136–138 | Prediction and the decision boundary                                                           | <b>Spr26 #6 Logistic Regression (a)</b> ; <b>Win26 #10 The Doctor Will See You Now (a, b, c)</b> ; F17 #7 The Most Important Features (e); W22 #7 Machine Teaching (d)                                                                                      |

## Block 14: Beyond Binary Classification (slides 139–140)

| Slides  | Concept                                         | Final exam problems                                                                                                                                                                                                                                                |
|---------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 139–140 | Regression, calibration, and other output types | <b>F24 #9 Recalibrating an Uncalibrated Model (a, b); F21 #7 Calibration of ML Algorithms (a–d);</b> Spr26 #1 Short Answer (b); F24 #1 Short Answer (b); F17 #6 Gaussian Naive Bayes; F17 #7 The Most Important Features (d, deep nets); Spr17 #9 Multiclass Bayes |

## Exam Index

All exams and solutions are linked from the [CS109 final exam page](#).

| Code         | Exam              | Problems            | Solutions            |

## Problem Titles by Exam

A quick lookup so you can find a problem without opening every PDF.

| Exam         | Problems                                                                                                                                                                                                                                                                    |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Spr26</b> | 1 Short Answer; 2 Fraud Detection; 3 Support Chat Requests; 4 Warehouse Shipping; 5 Hidden Chambers in the Pyramid of the Sun; 6 Logistic Regression; 7 Testing a New Medicine; 8 Debugging a Bootstrap; 9 Decision Tree Entropy                                            |
| <b>Win26</b> | 1 Let’s Get This Party Started; 2 Powering a Town; 3 Let’s Tree Max; 4 Are We Cooked?; 5 Two LLMs Walk Into A Bar; 6 That’s Private; 7 Playing it Safe; 8 It’s Gamma Time; 9 Genomics and Sampling; 10 The Doctor Will See You Now                                          |
| <b>Win25</b> | 1 Short Answer; 2 In-Vitro Fertilization; 3 Bag of Coins; 4 Microcontroller Precision Error; 5 Exponential Backoff; 6 Indus Valley Script; 7 Estimating Course Size; 8 Bayesian RNA Sequencing; 9 MLE of a Truncated Normal Distribution; 10 Logistic Regression Conceptual |
| <b>F24</b>   | 1 Short Answer; 2 Airline Flights; 3 Board Games; 4 Song of the Quarter; 5 What Name Doesn’t Give Away Age?; 6 Hidden Chambers in the Great Pyramid; 7 Sorted Random Values; 8 MLE of Negative Binomial; 9 Recalibrating an Uncalibrated Model                              |
| <b>F23</b>   | 1 Short Answer; 2 Don’t Quit Until You Are Ahead; 3 Popcorn; 4 Delicate Polling; 5 Water Levels; 6 Logistic Regression Priors; 7 Estimating Child Vocab Size                                                                                                                |

| Exam         | Problems                                                                                                                                                                                                                  |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>F22</b>   | 1 Short Answer; 2 Machine Learning; 3 Night Sight; 4 Penalty Shootout; 5 Better; 6 B-Reel; 7 Code Survival; 8 Approximate Counting Algorithm; 9 Ranking                                                                   |
| <b>W22</b>   | 1 Short Answer; 2 Quantitative Art History; 3 Beta $\pm$ ; 4 Bayesian Carbon Dating; 5 Reliability Engineering; 6 Rank Ordering of Samples; 7 Machine Teaching                                                            |
| <b>F21</b>   | 1 True or False; 2 Algorithmic Art; 3 How Lucky!; 4 Probabilistic Supply Chains; 5 Chess.com Puzzles; 6 P-Hacking; 7 Calibration of ML Algorithms                                                                         |
| <b>F17</b>   | 1 Missing Not at Random; 2 Occupy Mt Gox; 3 Timing Attack; 4 Learning While Helping; 5 Expected Maximum Uniform; 6 Gaussian Naive Bayes; 7 The Most Important Features                                                    |
| <b>Spr17</b> | 1 Random Encounter Redux; 2 Letters of Recommendation; 3 Hindenbug; 4 NBA Finals Week; 5 Gaussian Blur; 6 Improved Exam Grading; 7 Differential Privacy; 8 Windfarm Modeling; 9 Multiclass Bayes; 10 Logistic Vision Test |

### Two closing observations.

1. The exam will concentrate on machine learning problems, though there will be some others that you will want to be able to solve (see the next bullet).
2. The four topics that appear on essentially *every* final are Bayes' Theorem, choosing between Poisson and Exponential, the Central Limit Theorem, and MLE. If you are triaging, start there.

*Good luck. You have done the reading, the psets, and twenty+ worksheets. You are ready.*
