## Mathematics Enters the 20th Century

> If we would obtain an idea of the probable development of mathematical knowledge in the immediate future, we must let the unsettled questions pass before our minds and look over the problems which the sience of today sets and whose solution we expect from the future.

- In 1900, the eminent German mathematician David Hilbert set out a series of challenging problems for mathematicians in the twentieth century.
- Many of those problems turned out to be

David Hilbert (1862-1943)

- Several of Hilbert's 23 original problems, along with others he devised later, were resolved in a way that shook the foundations of the mathematical community.

## Hilbert's Entscheidungsproblem

- Of the problems that have significance to computer science, the most important is the Entscheidungsproblem, which was posed in 1928. In informal terms, the Entscheidungsproblem can be expressed as follows:

> Is it possible to find a mechanical procedure that can determine, given a specific proposition in a formal system of symbolic logic, whether that proposition is provable within that system?

- Hilbert and the mathematicians of his day assumed that such a mechanical procedure was indeed possible, but a series of mathematical results in the 1930s-by Kurt Gödel, Alonzo Church, Alan Turing, and Emil Post-showed that such a mechanical procedure is a logical impossibility.

## Kurt Gödel's Incompleteness

- Kurt Gödel had a set of "incompleteness theorems" that discussed formal systems with respect to consistency, completeness, decidability.
- First incompleteness theorem:
- Any consistent formal system, F, within which a certain amount of elementary arithmetic can be carried out is incomplete; i.e., there are statements of the language of F , which can neither be proved nor disproved in F .
- Second incompleteness theorem:
- For any consistent system F within which a certain amount of elementary arithmetic can be carried out, the consistency of F cannot be proved in F itself.

## Kurt Gödel's Incompleteness

- Gödel's Incompleteness theorems can be thought of as follows:
- Any set of axioms is either self-contradictory, or cannot prove some true statement about numbers. You can still prove every logical consequence of the axioms you have, but you can never get enough axioms to ensure that every true statement about numbers is a logical consequence of them.
- In other words: there will always be true facts that are not a logical consequence of your axioms.

## Alan Turing's Contribution

- Alan Mathison Turing, a young British mathematician just out of Cambridge, helped settle the Entscheidungsproblem by developing a model for computation by a mechanical procedure.
- Turing's model-which is now known as a Turing machine-is a central concept in theoretical computer science.
- Turing is widely recognized as one of the most important figures in the history of

Alan Turing (1912-1954) computer science. The field's most prestigious prize is the Turing Award, which is given in his honor.

## Designing the Turing Machine

- In his groundbreaking 1936 paper, "On computable numbers, with an application to the Entscheidungsproblem," Turing described the process of computation in informal terms:

[^0]- These operations and the notion of a "state of mind" form the basis for the Turing machine.

## Turing Machine Components

Computation requires:

- Scratch paper
- An unbounded amount of space
- At least two symbols
- A read/write mechanism
- Some form of program control

## Representing Numbers

- Even though the standard Turing machine alphabet consists of the digits $\mathbf{0}$ and $\mathbf{1}$, it is not practical to represent numbers in binary. Why?
- Instead, numbers will be written in unary in which each number is written as a sequence of $\mathbf{1 s}$. The $\mathbf{0}$ symbol is used to indicate the start and end of a number.
- An input configuration for the Turing machine is well-formed if it consists of a single number in which the tape head appears over the first 1 digit.
- A Turing machine program is a function if it starts with one well-formed number and ends with a well-formed number.

## Online Turing Machine Simulator https://turingmachinesimulator.com

In order to convert from our version of the Turing machine description to the online simulator, you can run a script here (the " $l$ "s are lowercase Ls)

## https://tinyurl.com/yccl9e2l

To use the spreadsheet:

1. Go to the link above, and sign into Google.
2. Make a copy of the spreadsheet: File->Make a copy...
3. Name and write your program (default is the Add3 program) in red.
4. Click on the "Convert Turing Machine" button.
5. Click "Continue" when asked to authorize.
6. Click your account.
7. When you see "turing_machine_conversion wants to access your Google Account..." scroll down and click "Allow"
8. Copy/paste the column E3 into https://turingmachinesimulator.com

## The Add3 Function $\left(\mathrm{M}_{+3}\right)$

Try it with an input value of 2 :

## The Doubler Function $\left(\mathrm{M}_{2 \mathrm{x}}\right)$

|  | $\mathbf{0}$ | $\mathbf{1}$ |
| :---: | :---: | :---: |
|  | OR0 | OR2 |
| $\mathbf{2}$ | OR3 | 1R2 |
| $\mathbf{3}$ | 1R4 | 1R3 |
| $\mathbf{4}$ | 1 L 5 |  |
| $\mathbf{5}$ | OL6 | 1 L 5 |
| $\mathbf{6}$ | OR1 | 1 L 6 |
|  |  |  |

## The Doubler Function $\left(\mathrm{M}_{2 \mathrm{x}}\right)$

|  | $\mathbf{0}$ | $\mathbf{1}$ |
| :---: | :---: | :---: |
|  | ORO | OR2 |
| $\mathbf{2}$ | OR3 | 1R2 |
| $\mathbf{3}$ | 1R4 | 1 R 3 |
| $\mathbf{4}$ | 1L5 |  |
| $\mathbf{5}$ | OL6 | 1L5 |
| $\mathbf{6}$ | OR1 | 1 Ly 6 |
|  |  |  |

How does this machine work?

## https://turingmachinesimulator.com

## Exercise: Subtraction

Write a program that takes two numbers on the tape and subtracts the second from the first. Thus, if the initial tape contains

the final tape should look like this:

Assume for the moment that the first number is larger than the second. What happens to your program if that isn't true?

## Composing Machines $\left(\mathrm{M}_{2 \mathrm{x}+3}\right)$

Suppose you wanted to compute the function $2 x+3$, given that you have the machines $\mathrm{M}_{2 \mathrm{x}}$ and $\mathrm{M}_{+3}$.

- Start with the two machines.
- Renumber the states in $\mathrm{M}_{+3}$.
- Combine the machines.
- Change halt transitions in $\mathrm{M}_{2 \mathrm{x}}$ to jump to $\mathrm{M}_{+3}$.

## The Busy Beaver Problem

- Although it is possible to introduce the notion of undecidable problems using Turing's original argument involving a "universal" Turing machine, it is much easier to do so in the context of a more recent problem posed by Tibor Radó in the early 1960s:

What is the largest finite number of 1 s that can be produced on blank tape using a

Tibor Radó (1895-1965) Turing machine with $n$ states?

- This problem is called the Busy Beaver Problem.

The End

[^0]:    It may be that some of these changes necessarily involve a change of state of mind. The most general single operation must therefore be taken to be one of the following:
    (a) A possible change of symbol together with a possible change of state of mind.
    (b) A possible change of observed squares, together with a possible change of state of mind.
    The operation actually performed is determined, as has been suggested above, by the state of mind of the computer and the observed symbols.
