

Social Computing CS 278 · SOC 174 · SOC 274 | Stanford University | Michael Bernstein

How can we design the social systems that we inhabit?

What is social computing? Social computing systems are computational systems that mediate

social interactions.

bluesky, discord, doodle, doordash, ebay, ed, email, facebook, facetime, fizz, github, groupme, imdb, instagram, line, lyft, mastodon, mechanical turk, messenger, MMOs, pinterest, reddit, signal, slack, snapchat, spotify, skype, stackoverflow, threads, tiktok, tumblr, twitch, twitter (x), uber, venmo, viber, weibo, whatsapp, when 2 meet, wikipedia, youtube, zoom

Sometimes they help us get things done; Sometimes they make our lives more fun; Sometimes they are critical to governance and decision making.

What is social computing design?

Increasingly, we are fashioning social environments online.

Social computing design asks how to fashion those environments to support the community in achieving its goals.

How do we cross the chasm between the social interactions that the group wants to support, and the computing techniques that we know about or have at our disposal? [Ackerman 2000]

Every social system is designed

should students interact with me?

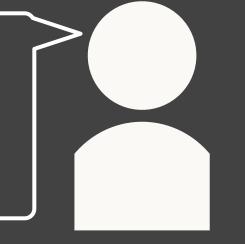

business partner? With your dormmates?

mitigate them?

- How should students interact with each other in this class? How
- If you don't design, you default. And often the default is far worse. What happens if you don't set norms with your project, research, or
 - What kinds of harms arise if we don't critically design the system to

I designed a theme park for people to come together!

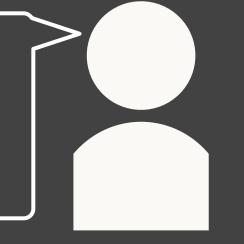

Yikes! Fix your theme park, quickly!

Gentle parkgoers, this is a space for family fun. Please cut out the behavior, or be removed.

Also, let's redesign this area to make it a photo op rather than a space where fights are likely to break out.

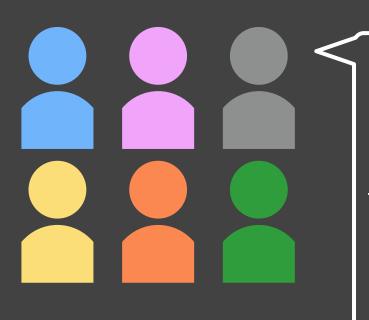

I designed a theme park for people to come together!

Yikes! Fix your theme park, quickly!

No: we are not a theme park company, we are a technology company.

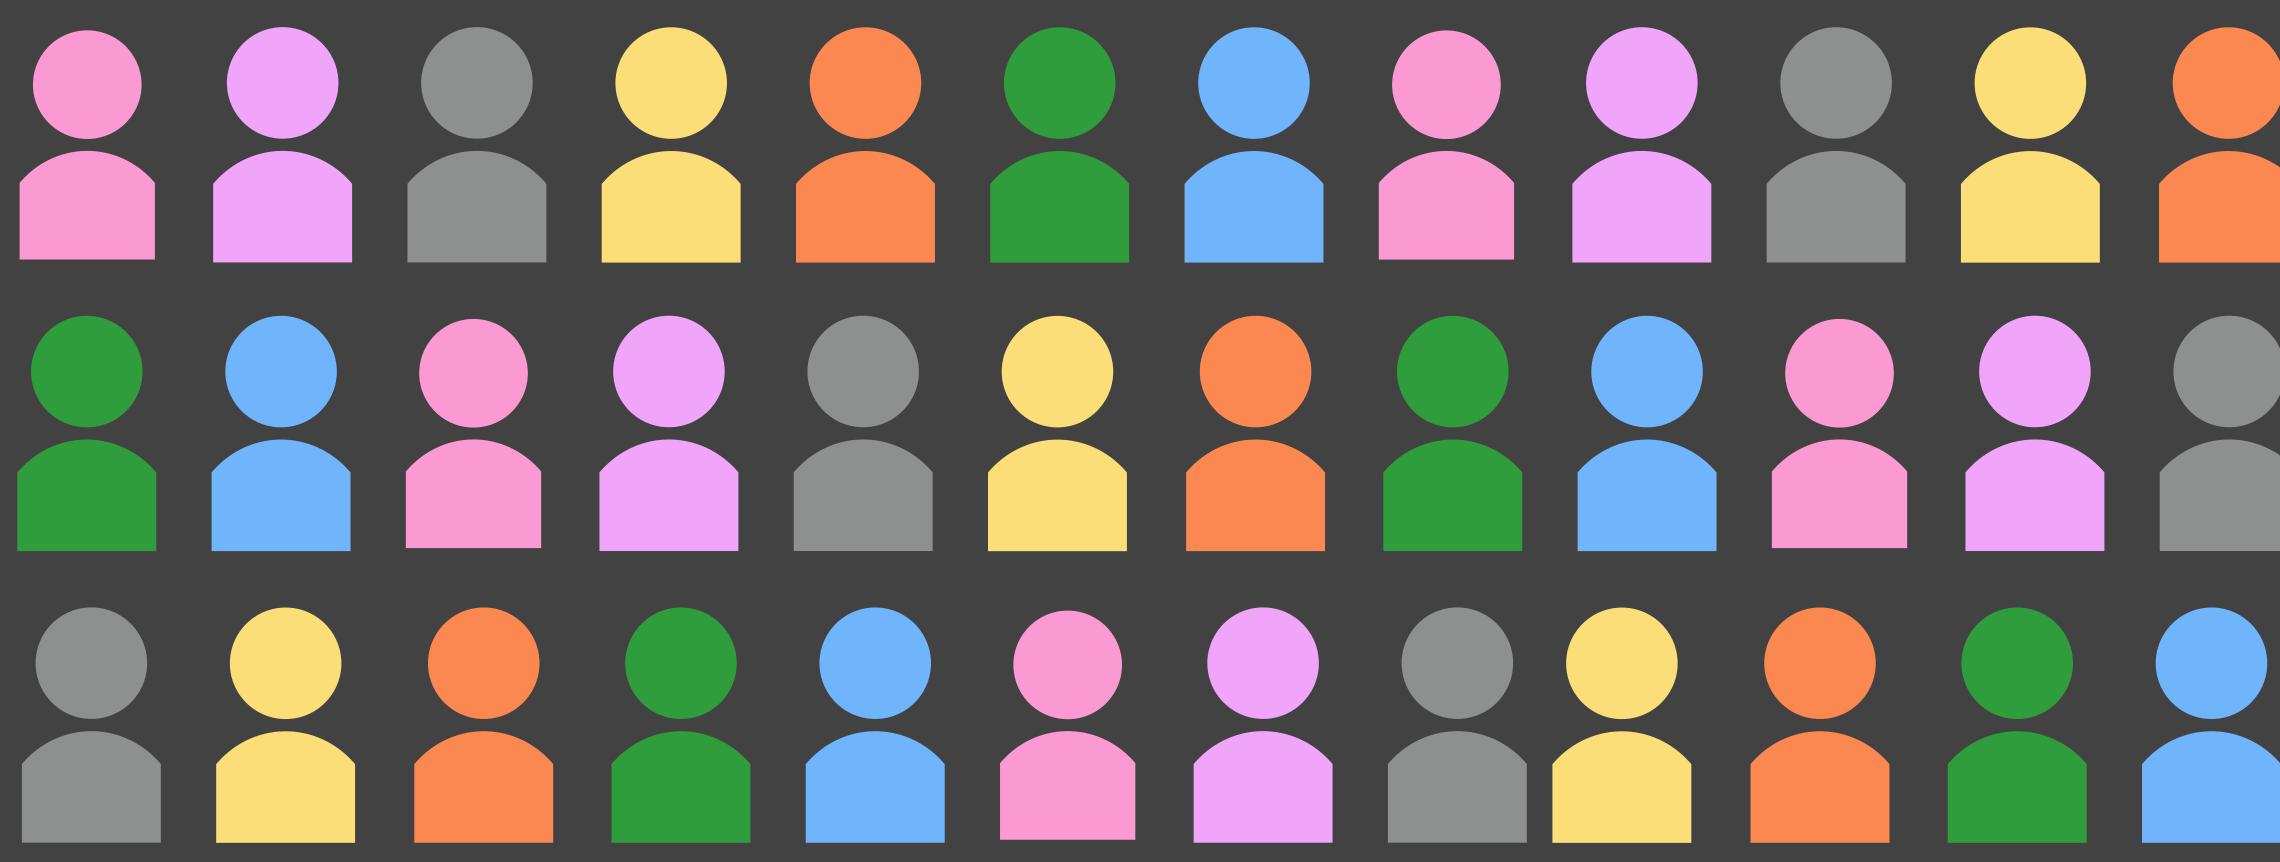

Theme parks are responsible for both the design and the behaviors inside their walls. Let's redesign it.

Let's discuss [contentous and fraught topic]. I will moderate.

Let's discuss [contentous and fraught topic]. EVERYBODY HAS MICS. GO.

There are right and wrong ways to design social spaces

We cannot force good behavior or exclude the possibility of bad behavior.

But our design—the way our system empowers people to establish norms and enforce them—shapes the social outcome.

"We shape our buildings; thereafter, they shape us." —Winston Churchill

Or maybe it never takes off and winds up a ghost town.

Never just paste social bits into another application. It's not about whether you have points, or friend/follow models, or real names or pseudonyms. At least not directly.

It's like saying your bridge will work if you have strong ropes. The materials matter, but if the global design stinks, even the best materials won't save you.

How do you design a social computing systems that helps promote the behaviors that the group wants to see in the system? What about a design makes people... Feel safe? Post funny memes? Engage in thoughtful discussion?

How do I encourage specific norms on the system?

How do I prototype my idea?

What changes as my social computing system grows?

How do we govern these systems?

How do I manage antisocial behavior, trolls, and ghosting?

How do I get the world to collaborate with me on something? Do Als impact social environments? How do I manage ethical design tradeoffs between groups of people? Can I design for groups unlike me? How do I support groups in acting intelligently and not like mobs?

Why is social computing design a serious responsibility?

These systems have the opportunity to help us create a more {thoughtful, deliberative, fun, emotionally connected, empathic, just} society. However, they can also have the opposite effect.

What power do you have as a creator, and what responsibility do you have when creating? How do we draw on positive opportunities without unleashing Pandora's Box?

This class will teach...

- I. How we design effective social computing systems
- 2. The social scientific principles through which our designs influence behavior
- 3. The challenges we face in designing these systems ethically, and some strategies for addressing those challenges

This class will not teach... Engineering principles for web applications Take CS 142: Web Applications Algorithms and mathematical models for the social web Take CS 224W: Analysis of Networks Take MS&E 135: Networks The process of human-centered design Take CS 147: Introduction to Human-Computer Interaction

Expectations The Social Computing Fundamental Standard In our social computing designs for assignments, use reasonable judgment

harms.

Code of Conduct

Create an engaged and positive course environment. See the Community Covenant for specific guidelines. Assume good intentions of your classmates and staff. We remove folks from the class social environments if they violate.

Questions so far?

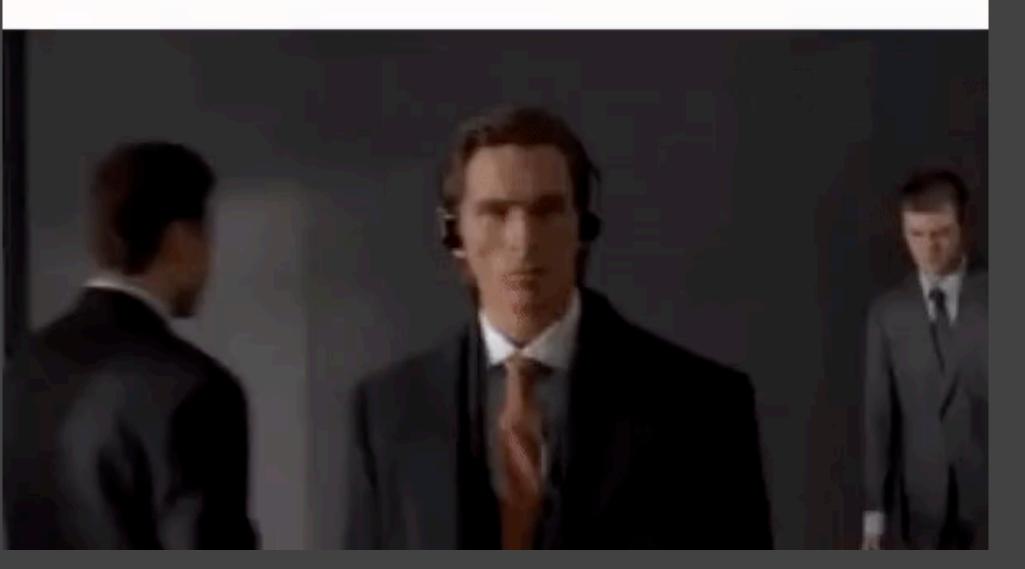

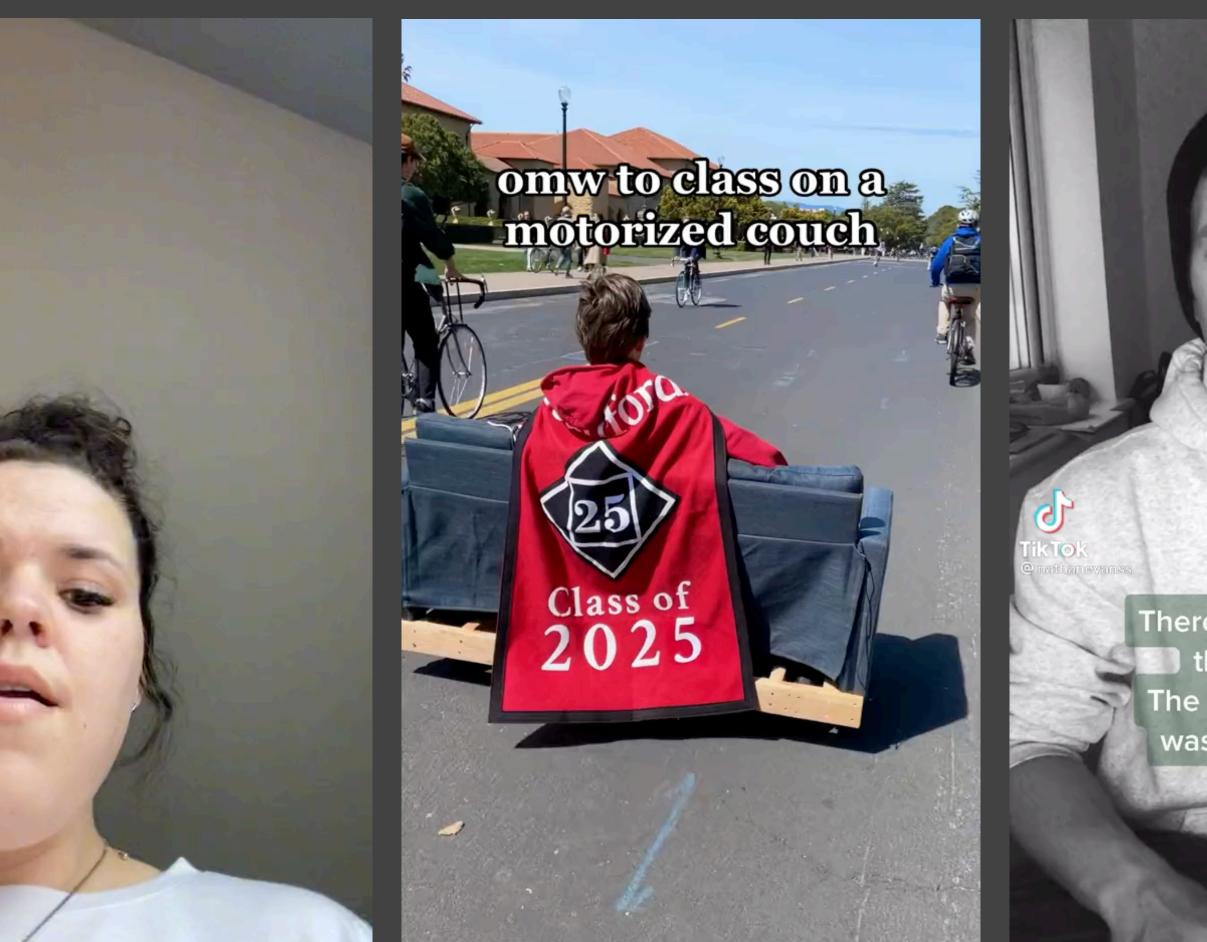

Going Viral Starting the class in microcosm

Viral content What makes something go viral? [3min]

Lofi girl on her way to take the exam after 868 days of studying:

Surface features of a meme Sharable URL ... but these characteristics are Simple message Low friction to share #catchyhashtag

themselves insufficient, and relying on them means you're not really trying.

Backing up: where does cultural innovation come from?

Often, we discuss cultural innovation from the perspective of the structure of the communities that produce it, referred to as core and periphery

Core: mainstream Periphery: marginal communities

Cultural innovation is often greatest amongst those occupying an intermediate, bridging position between core and periphery [Cattani and Ferriani 2008; Dahlander and Frederiksen 2012].

Backing up: where does cultural innovation come from?

Why would intermediate positions in the network be the sources of cultural innovation?

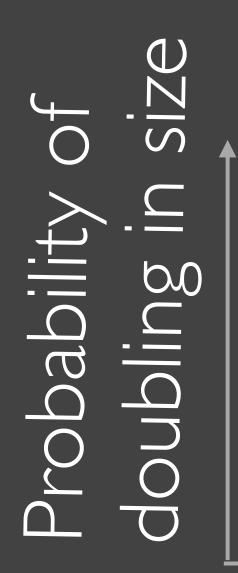

And what does this mean about how you go about designing social systems that spread?

Discuss [2min]

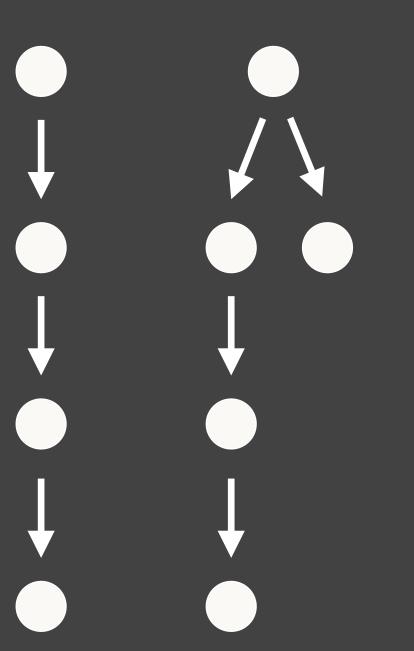

What peripheral communities are you a bridge into? How might they bring new perspectives?

31

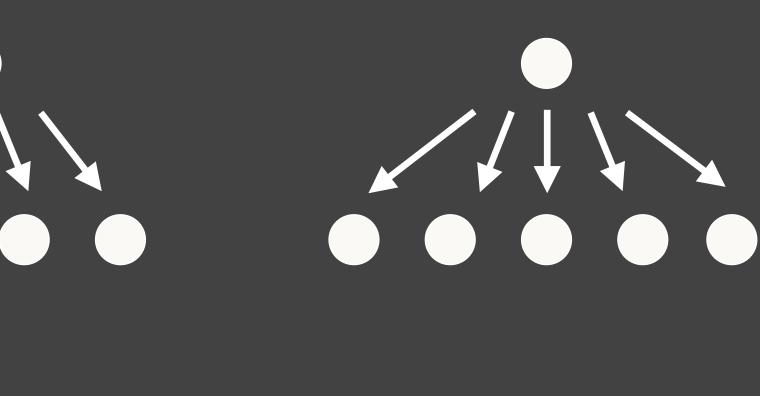

Friends weren't interested

Broad appeal

Only your friends were interested

Initial structure

[Cheng et al. 2014]

Feed algorithms amplify these effects Jeff Allen @jeff4llen

"For You" feeds show you what they predict that you will engage with

So, going viral often means optimizing for what the algorithm is optimizing for, which means that the algorithm continues feeding the content to more people

According to the Heavy Ranker readme, it looks like this is the "For you" feed ranking formula is

Each "is_X" is a predicted probability the user will take that action on the Tweet.

Replies are the most important signal. Very similar to MSI for FB. github.com/twitter/the-al...

So it's deterministic? [Salganik, Dodds, and Watts 2006] Experiment: gather 48 songs of unknown songs from indie bands.

Create a Spotify clone for online music listening.

Recruit \sim 14,000 participants from an online teen forum

influence condition.

- Randomize participants into an independent condition or a social
 - Social influence: can see the number of previous downloads for the song Independent: no information about the number of previous downloads

So it's deterministic? [Salganik, Dodds, and Watts 2006]

parallel "worlds" where the download counts all start at 0.

Social influence random.randint(1,8) IS ZS JS 4S JS 6S /S 8S

Further randomize each participant into one of eight possible

random.choice([''influence'', ''independent''])

Independent random.randint(1,8)

So it's deterministic? [Salganik, Dodds, and Watts 2006] Result One: social influence increased both inequality and unpredictability of success. Result Two: The best songs rarely did poorly, and the worst rarely

did well, but any other result was possible.

Further evidence from a social content aggregator: randomly bumping up initial scores inflated final scores; randomly penalizing initial scores had few long-term effects [Muchnik, Aral, and Taylor 2013]

36

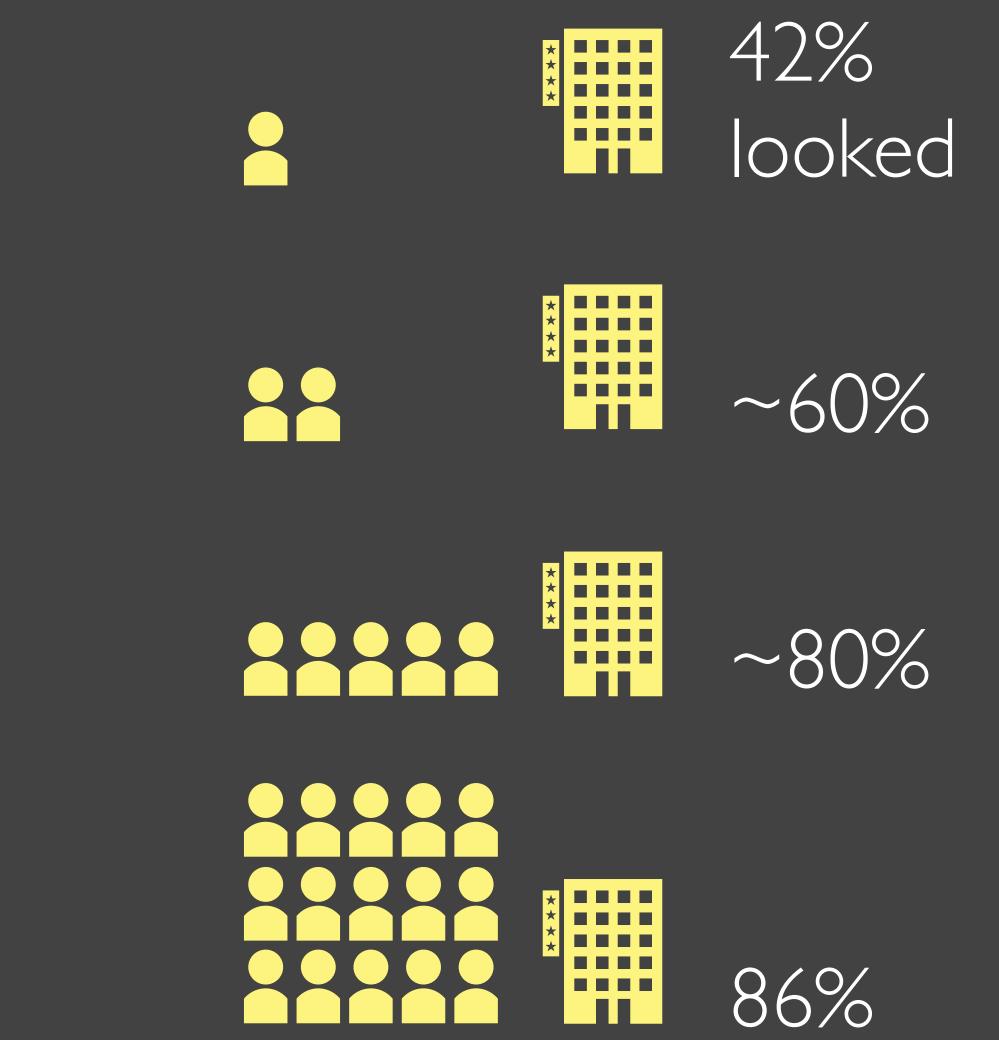

[Cialdini 2009]

Social proof: when people copy each others' behavior

In social situations when people are unable to determine the appropriate behavior, they look to what others are doing.

The assumption is that others know what they are doing, so their behavior becomes a kind of proof.

Looking up at a building Why? Social proof. [Milgram, Bickman, and Berkowitz 1968]

What It's Like When Reddit Wrongly Accuses Your Loved One Of Murder

Viral truth: it's hard [Vosoughi, Roy, and Aral 2018; Juul and Ugander 2021] Investigation of rumors spread on Twitter:

False news tends to be more "infectious": its cascades are larger.

The top 1% of false news cascades diffused to between 1000 and 100,000 people, whereas the truth rarely diffused to more than 1000 people.

What It's Like When Reddit Wrongly **Accuses Your Loved One Of Murder**

So now what? What makes a meme?

Michael's synthesis:

- I) Capture an unspoken, unacknowledged, or unarticulated zeitgeist.
- 2) Focus on one simple message, conveyed in a creative way
- 3) Know that you may need to take multiple cuts at it before you find the right angle or randomness falls in your favor.
- 4) Acknowledge that false, negative and aggressive content spreads faster, but don't give in. Focus on doing good in the world.

Assignment I: Going Viral Goal: Wrestle with the challenges in designing social behavior, and build intuitions for the challenges of social computing design. Goal: create a piece of content that goes viral. attempts and iterate! No negativity; create joy, not pain. submit reflections to Gradescope. Class voting to come. Details at cs278.stanford.edu

- You must create it. You may remix others' content. Make multiple
- Due next Tuesday at 11:59pm: submit meme to our class server, and
