

EE 359: Wireless Communications

Advanced Topics in Wireless

Dec. 7, 2017

Future Wireless Networks

Ubiquitous Communication Among People and Devices

Next-Gen Cellular/WiFi
Smart Homes/Spaces
Autonomous Cars
Smart Cities
Body-Area Networks
Internet of Things
All this and more ...

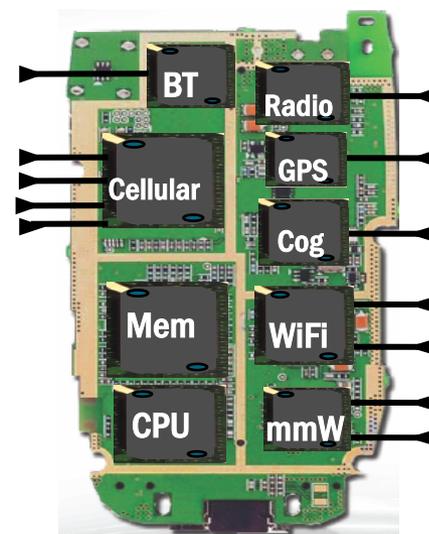

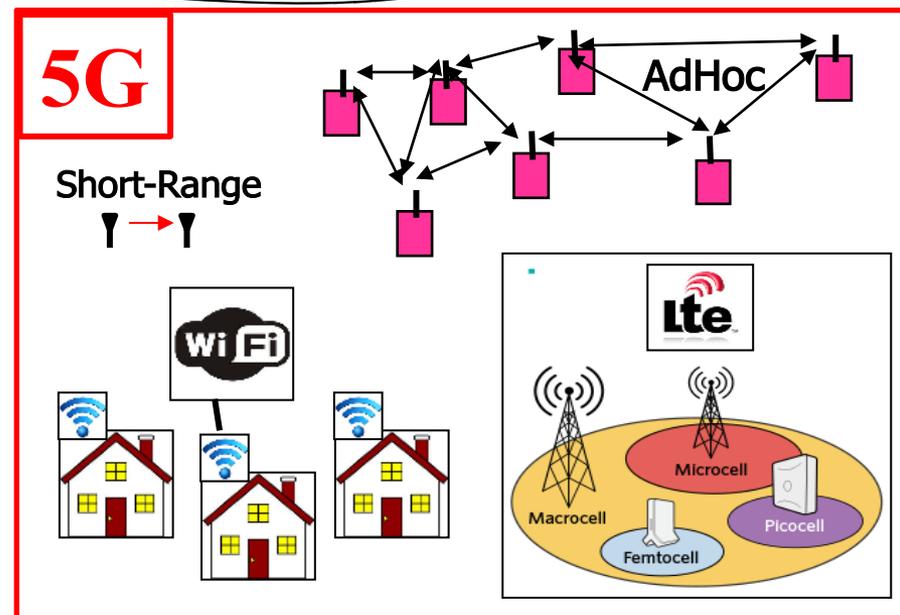

Challenges

• Network Challenges

- High performance
- Extreme energy efficiency
- Scarce/bifurcated spectrum
- Heterogeneous networks
- Reliability and coverage
- Seamless internetwork handoff

• Device/SoC Challenges

- Performance
- Complexity
- Size, Power, Cost
- High frequencies/mmWave
- Multiple Antennas
- Multiradio Integration
- Coexistence

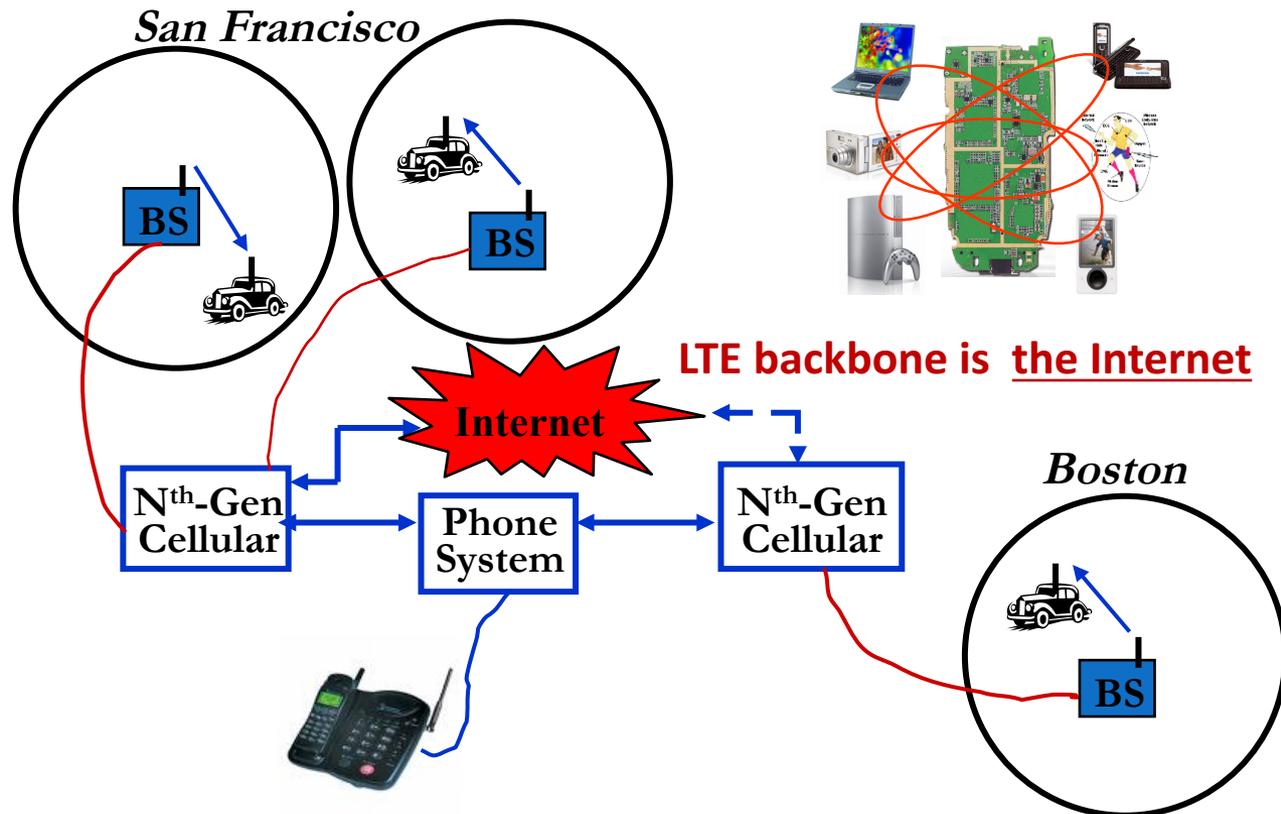

Emerging Systems

- New cellular system architectures
- mmWave/massive MIMO communications
- Software-defined network architectures
- Ad hoc/mesh wireless networks
- Cognitive radio networks
- Wireless sensor networks
- Energy-constrained radios
- Distributed control networks
- Chemical Communications
- Applications of Communications in Health, Biomedicine, and Neuroscience

Future Cell Phones

Burden for this performance is on the backbone network

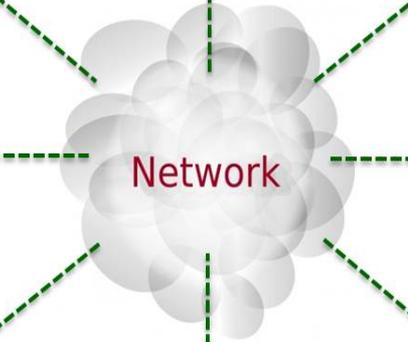

Much better performance and reliability than today
- Gbps rates, low latency/energy, 99.999% coverage

What is the Internet of Things:

Er
co

In
ca

ics,
ces,...

Va

d

Different requirements than smartphones: **low rates/energy consumption**

The Licensed Airwaves are "Full"

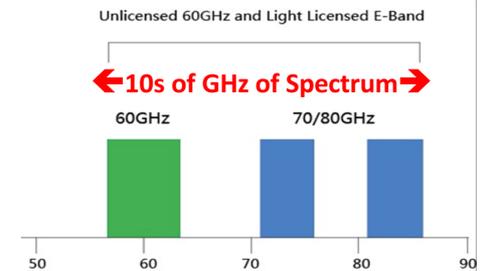

Source: FCC

Also have Wifi

And mmWave

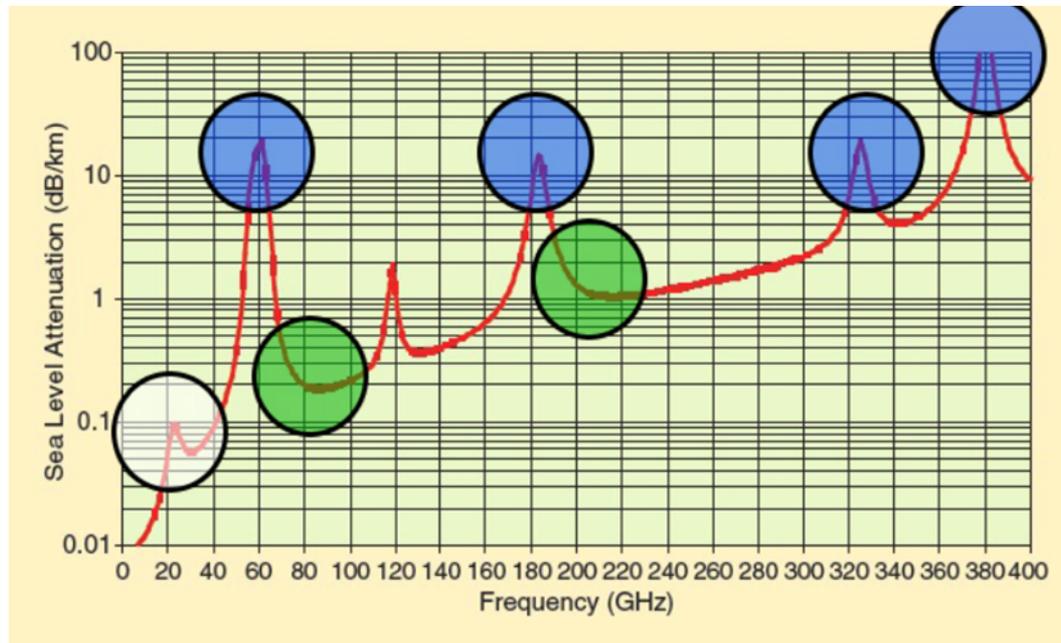

Enablers for increasing wireless data rates

- More spectrum (mmWave)
- (Massive) MIMO
- Innovations in cellular system design
- Software-defined wireless networking

mmW as the next spectral frontier

- Large bandwidth allocations, far beyond the 20MHz of 4G
- Rain and atmosphere absorption not a big issue in small cells

- Not that high at some frequencies; can be overcome with MIMO
- Need cost-effective mmWave CMOS; products now available
- Challenges: Range, cost, channel estimation, large arrays

What is Massive MIMO?

Dozens of devices

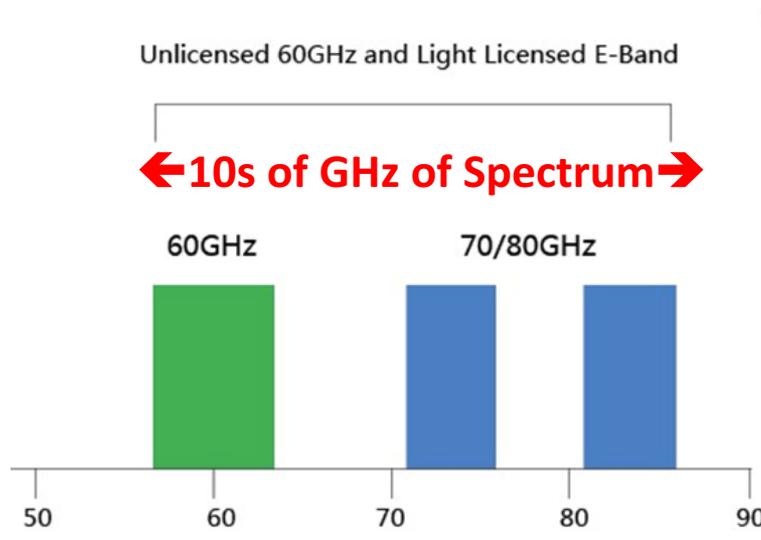

Hundreds of
BS antennas

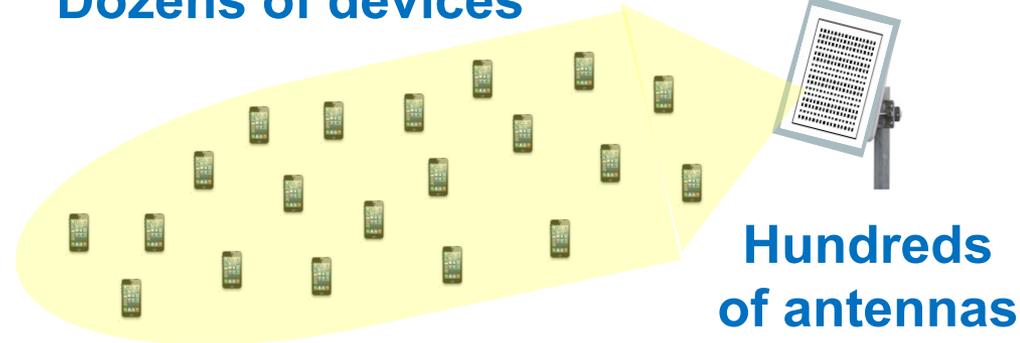

- A very large antenna array at each base station
 - An order of magnitude more antenna elements than in conventional systems
- A large number of users are served simultaneously
- An excess of base station (BS) antennas
- Essentially multiuser MIMO with lots of base station antennas

T. L. Marzetta, "Noncooperative cellular wireless with unlimited numbers of base station antennas," *IEEE Trans. Wireless Commun.*, vol. 9, no. 11, pp. 3590–3600, Nov. 2010.

mmWave Massive MIMO

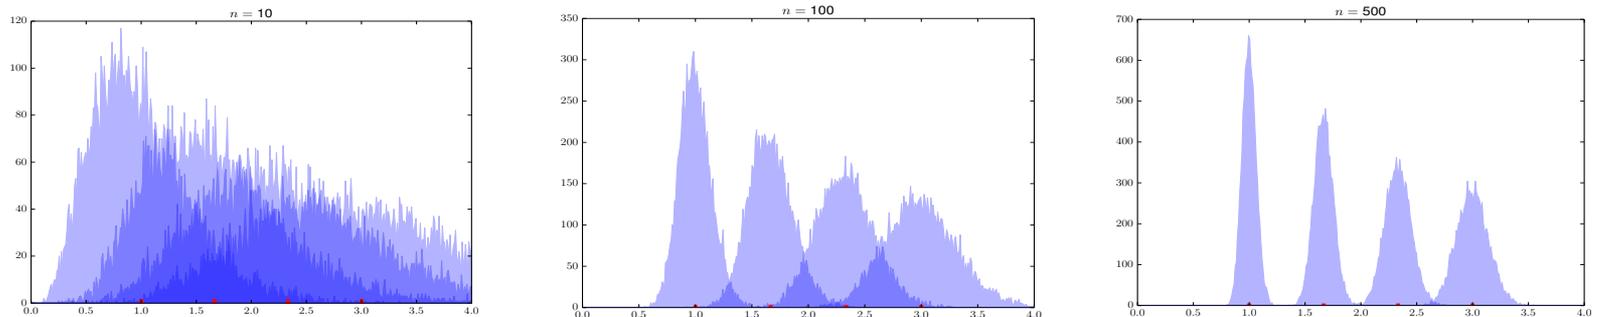

Dozens of devices

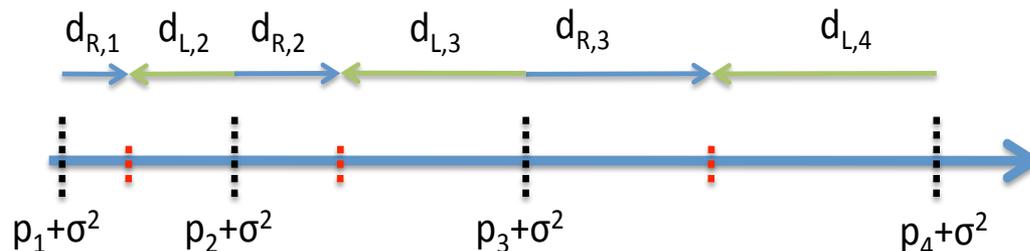

- mmWaves have large attenuation and path loss
- For asymptotically large arrays with channel state information, no attenuation, fading, interference or noise
- mmWave antennas are small: perfect for massive MIMO
- Bottlenecks: channel estimation and system complexity
- Non-coherent design holds significant promise

Non-coherent massive MIMO

- Propose simple energy-based modulation
- No capacity loss for large arrays: $\lim_{n \rightarrow \infty} C_{nocsi} = \lim_{n \rightarrow \infty} C_{csi}$
 - Holds for single/multiple users (1 TX antenna, n RX antennas)

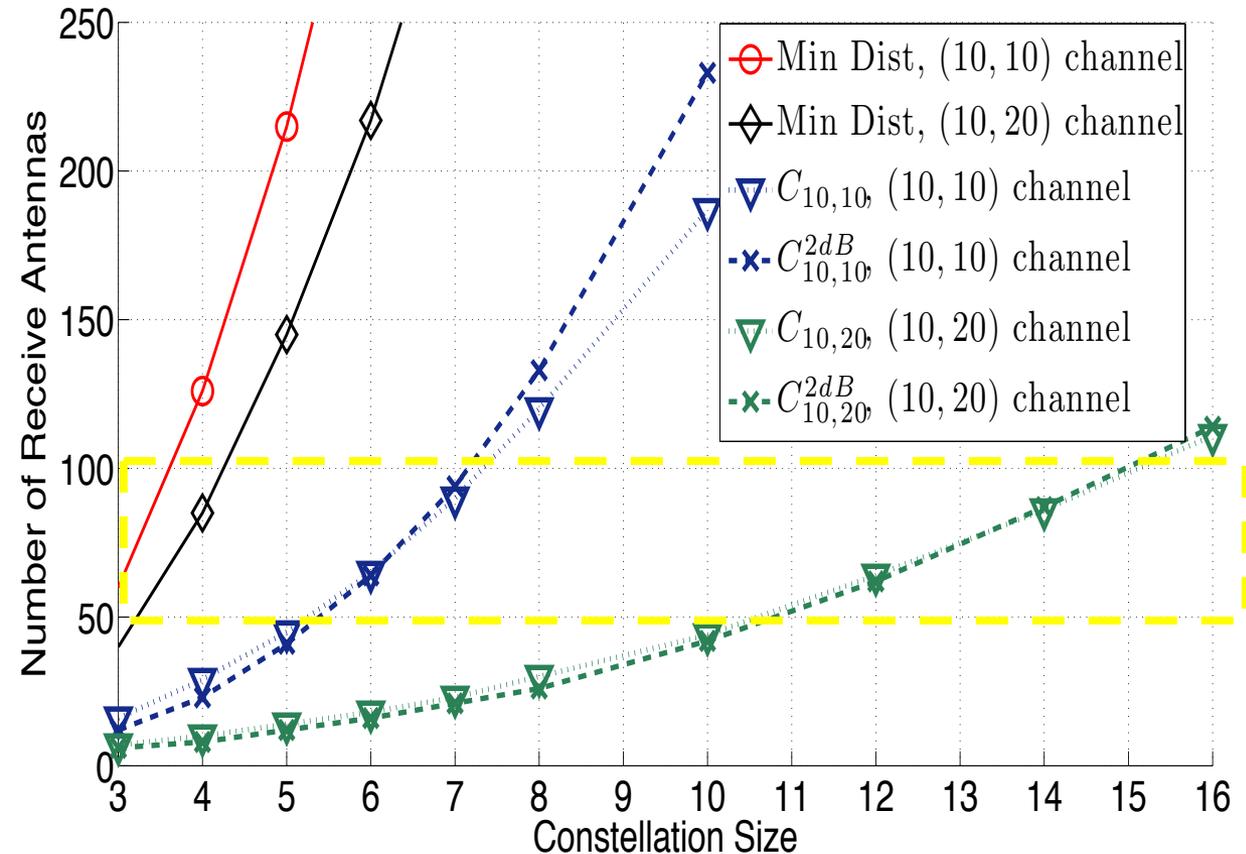

- Constellation optimization: unequal spacing

Need 50-100 antennas for an SER of 10^{-4}

Depending on data rate requirements

$$P_s = 10^{-4}$$

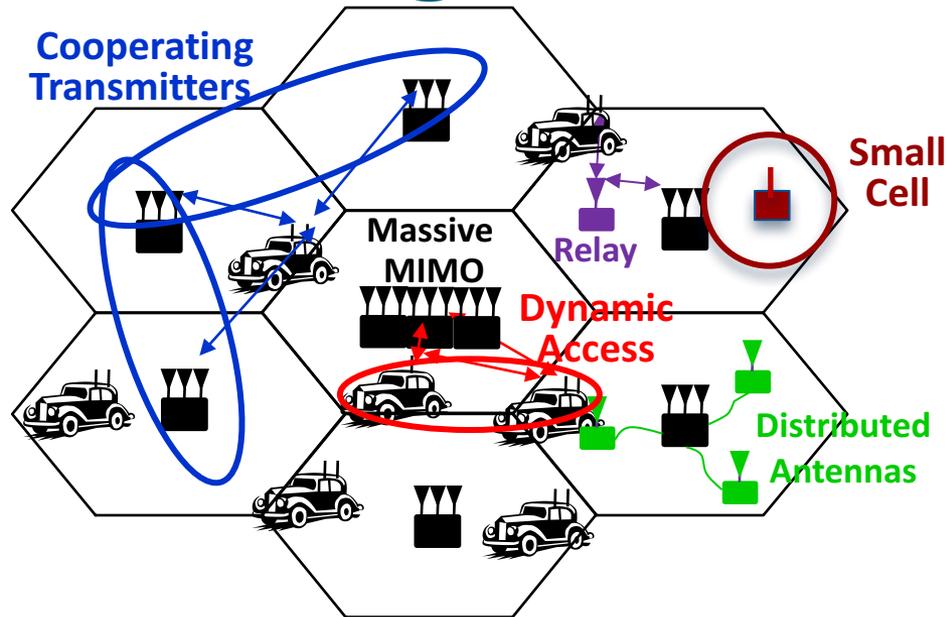

Minimum Distance
Design criterion:
Significantly worse
performance than
the new designs.

Design robust to
channel uncertainty

Noncoherent communication demonstrates promising performance with reasonably-sized arrays

Rethinking Cellular System Design

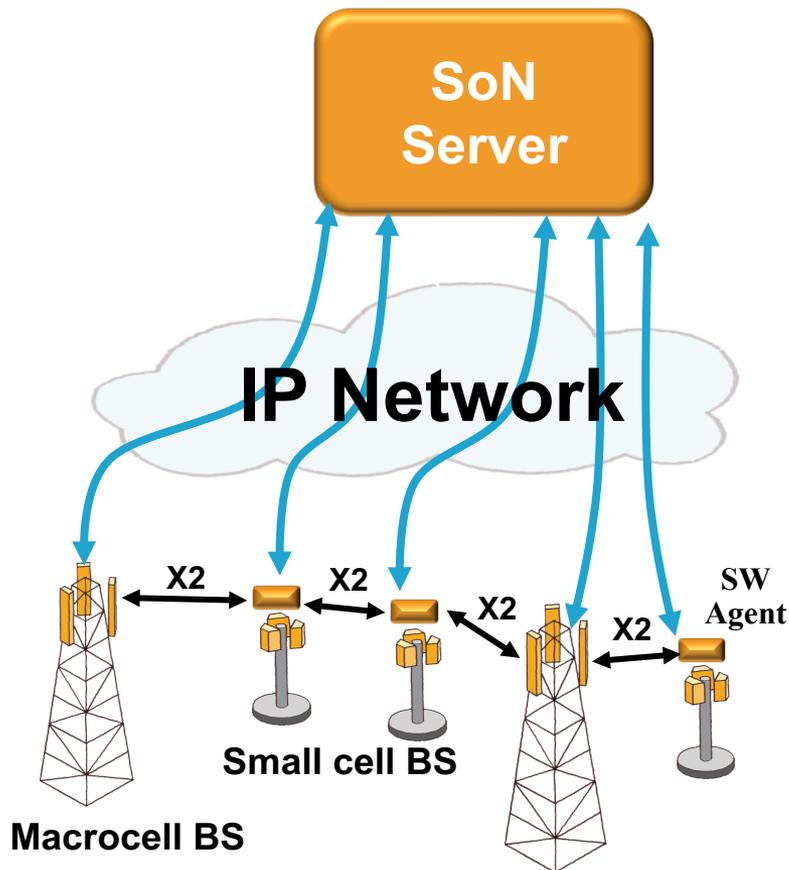

How should cellular systems be designed?

Will gains be big or incremental; in capacity, coverage or energy?

- Traditional cellular design assumes system is “interference-limited”
- No longer the case with recent technology advances:
 - MIMO, multiuser detection, cooperating BSs (CoMP) and relays
- Raises interesting questions such as “what is a cell?”
- Energy efficiency via distributed antennas, small cells, MIMO, and relays
- Dynamic self-organization (SoN) needed for deployment and optimization

Small cells are the solution to increasing cellular system capacity

In theory, provide exponential capacity gain

- Future cellular networks will be hierarchical
 - Large cells for coverage
 - Small cells for capacity and power efficiency
 - Small cells require self-optimization in the **cloud**
- Small Cell Challenges
 - SoN algorithmic complexity
 - Distributed vs centralized control
 - Backhaul and site acquisition

WiFi is the small cell of today

Primary access mode in residences, offices, and wherever you can get a WiFi signal

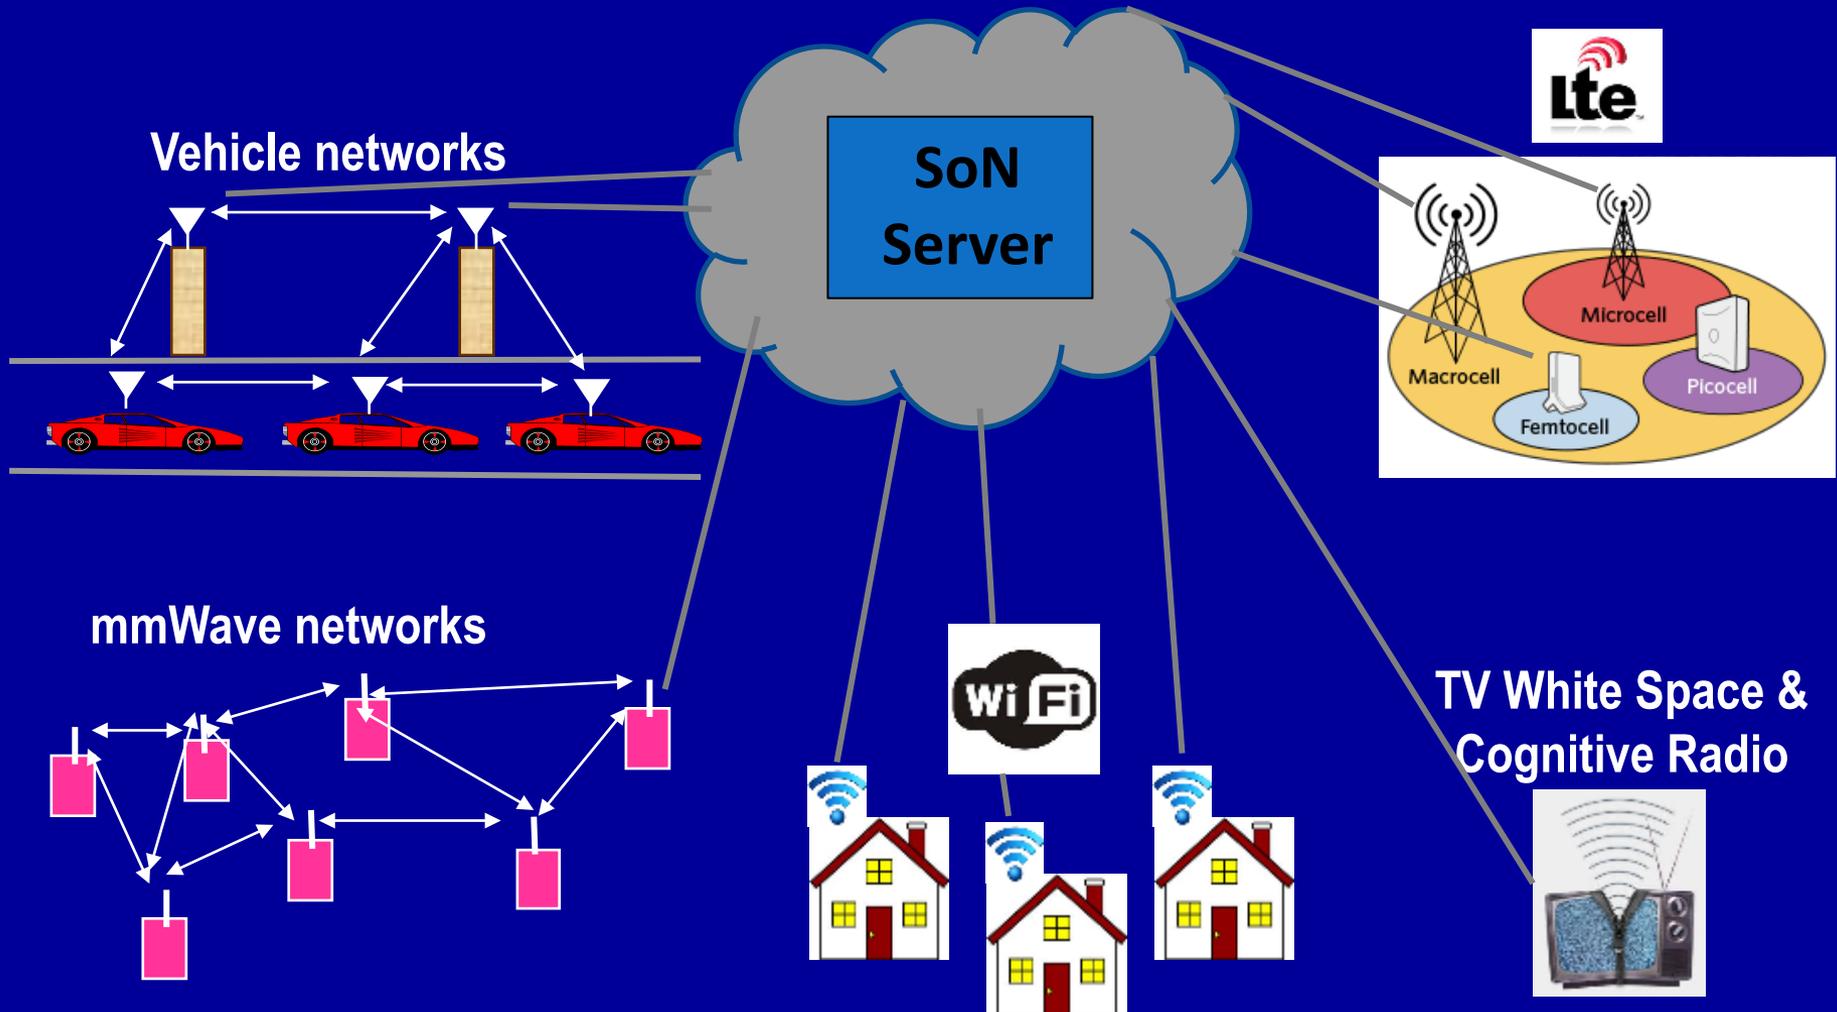

Lots of spectrum, excellent PHY design

The Big Problem with WiFi

- The WiFi standard lacks good mechanisms to mitigate interference in dense AP deployments
 - Static channel assignment, power levels, and carrier sense thresholds
 - In such deployments WiFi systems exhibit poor spectrum reuse and significant contention among APs and clients
 - Result is low throughput and a poor user experience

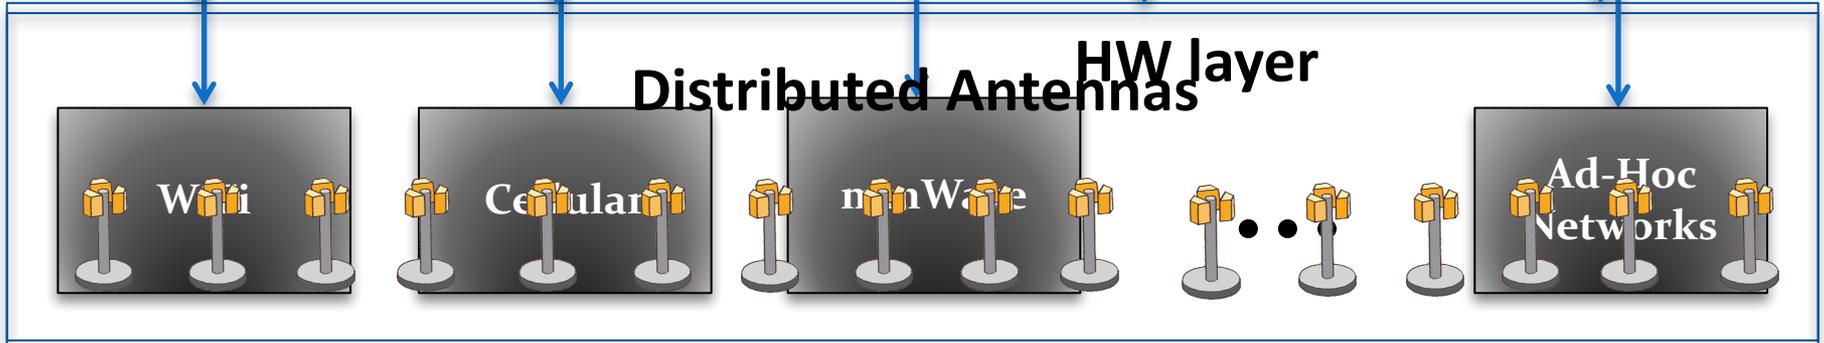

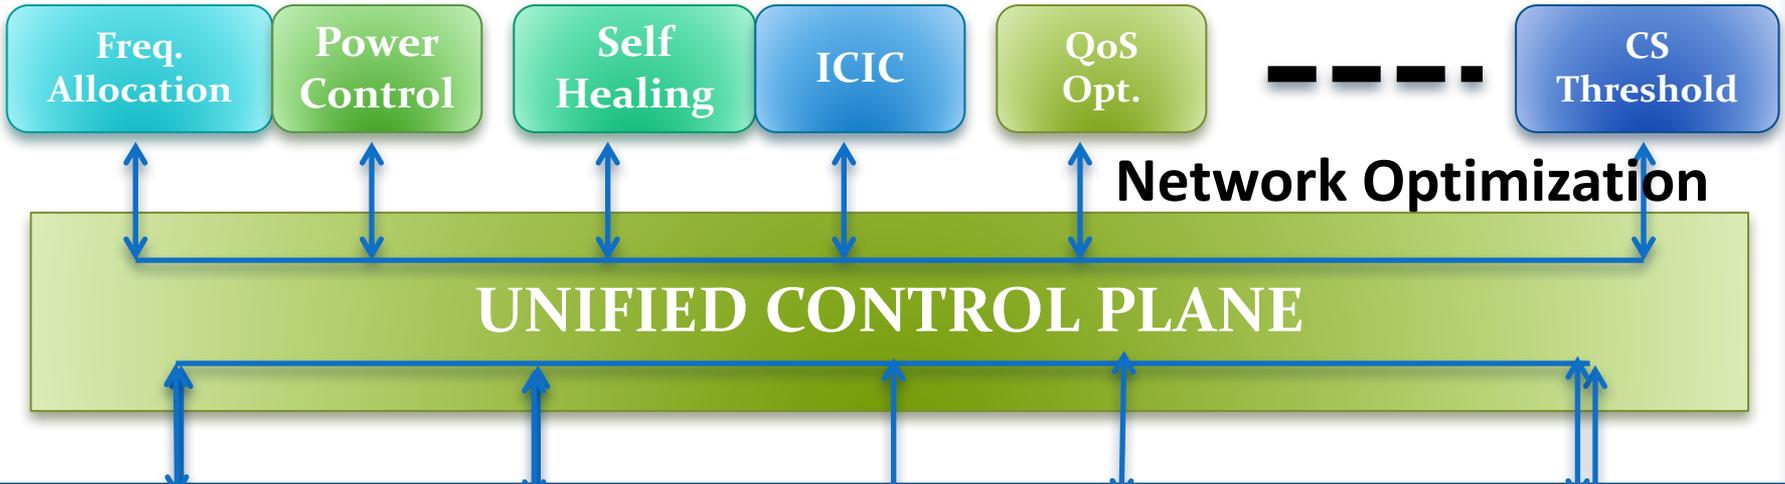

Why not use SoN for all wireless networks?

Software-Defined Network Architecture

(generalization of NFV, SDN, cloud-RAN, and distributed cloud)

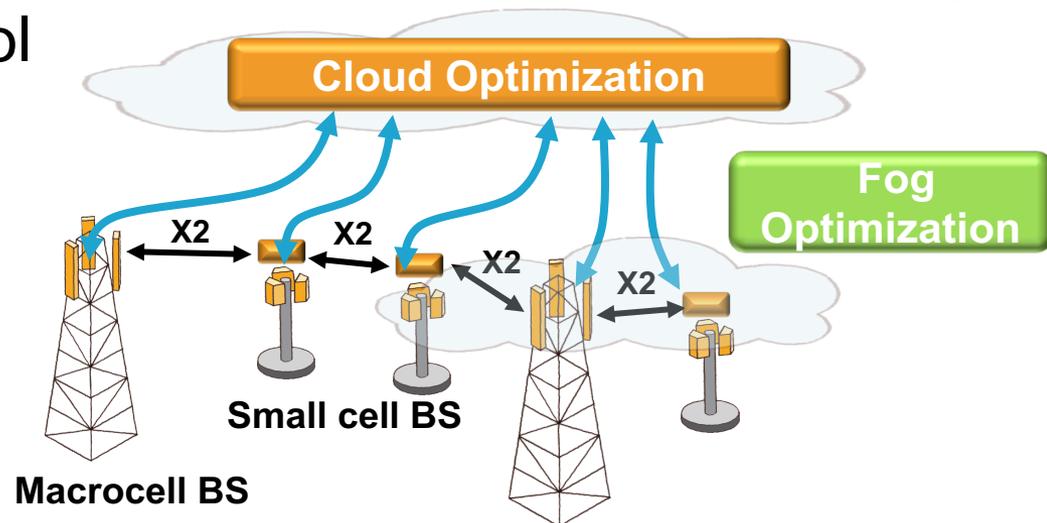

Cloud Computing

SDWN Challenges

- Algorithmic complexity
 - Frequency allocation alone is NP hard
 - Also have MIMO, power control, CST, hierarchical networks: *NP-really-hard*
 - Advanced optimization tools needed, including a **combination** of centralized (cloud) distributed, and locally centralized (fog) control

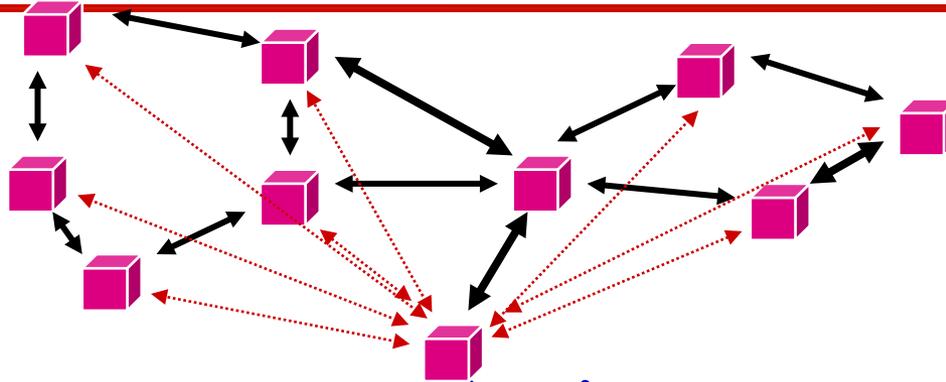

- Hardware Interfaces
- Seamless handoff
- Resource pooling

New PHY and MAC Techniques

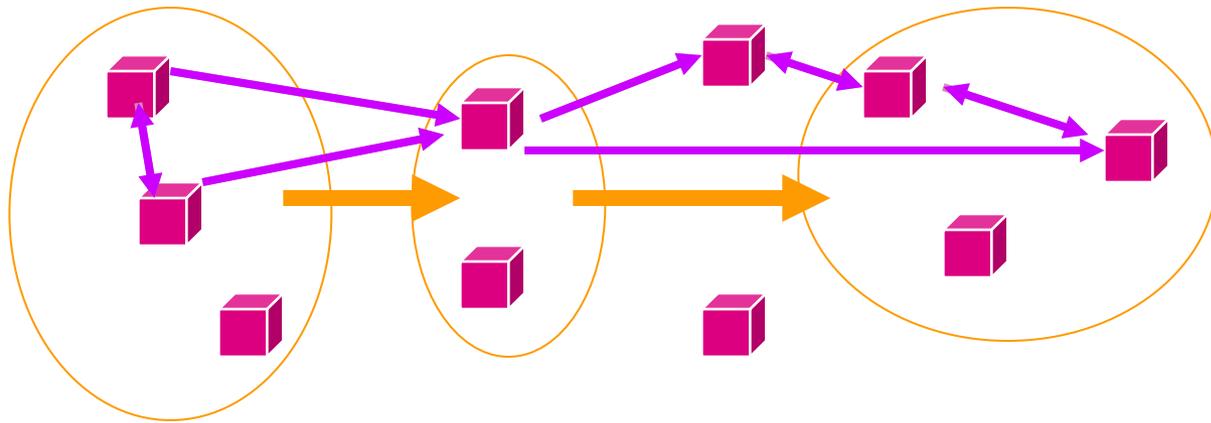

- New Waveforms
 - Robust to rapidly changing channels (OTFS)
 - More flexible and efficient subcarrier allocation (variants of OFDM)
- Coding
 - Incremental research (polar vs. LDPC), no new breakthroughs
- Access
 - Efficient access for low-rate IoT Devices (sparse code MAC, GFDM, OTFS, variants of OFDMA)
 - Access/interference mitigation for unlicensed LTE

Ad-Hoc Networks

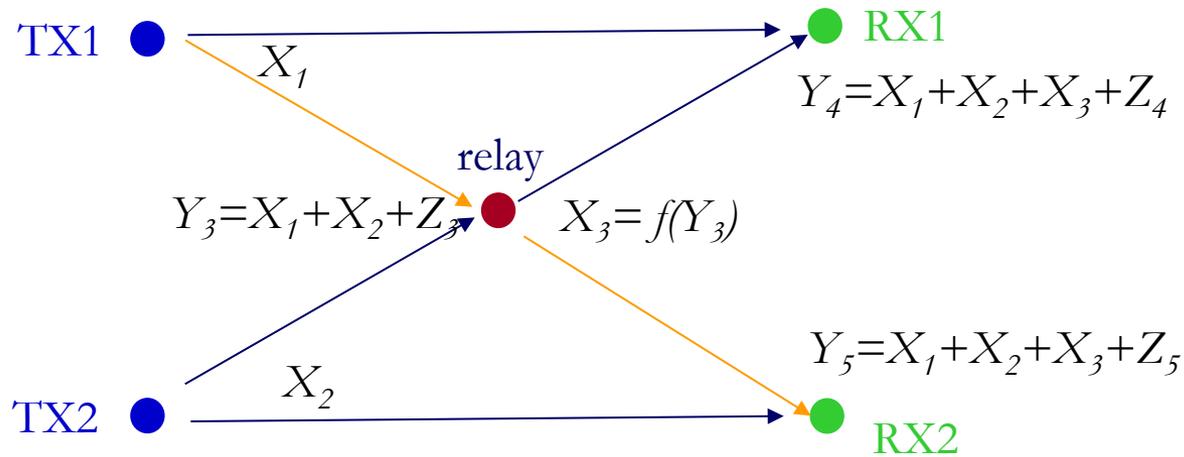

- Peer-to-peer communications
 - No backbone infrastructure or centralized control
- Routing can be multihop.
- Topology is dynamic.
- Fully connected with different link SINRs
- Open questions
 - Fundamental capacity region
 - Resource allocation (power, rate, spectrum, etc.)
 - Routing

Cooperation in Wireless Networks

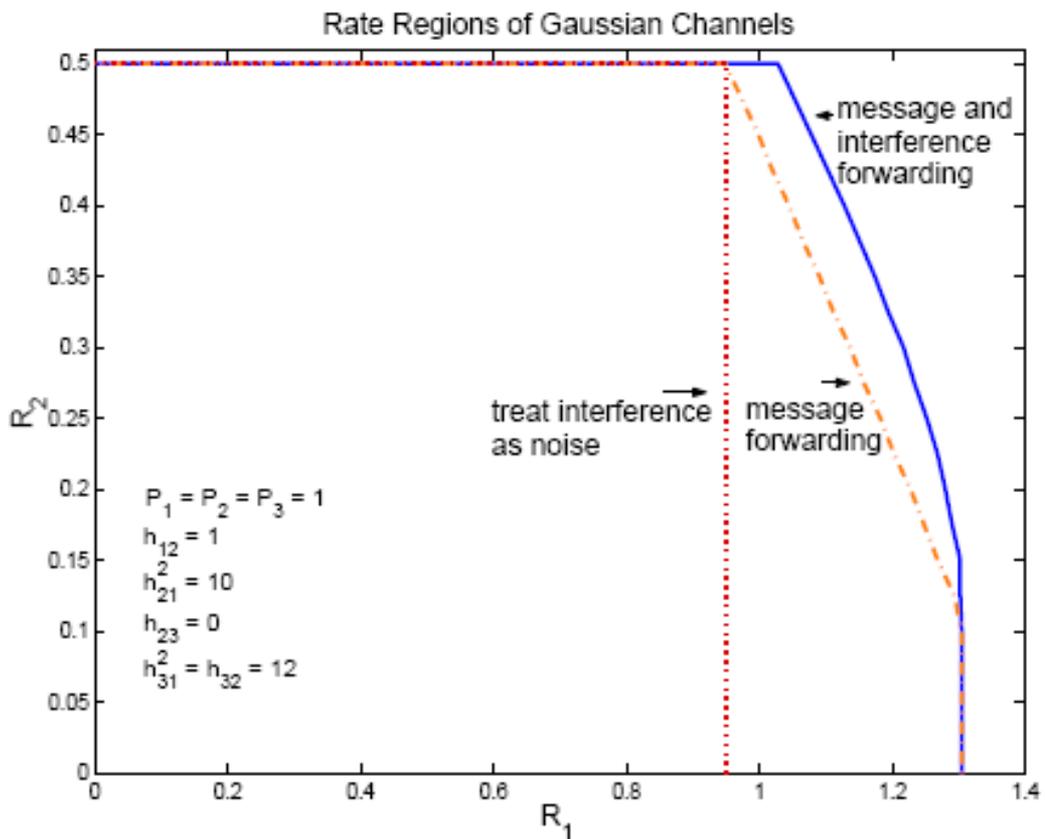

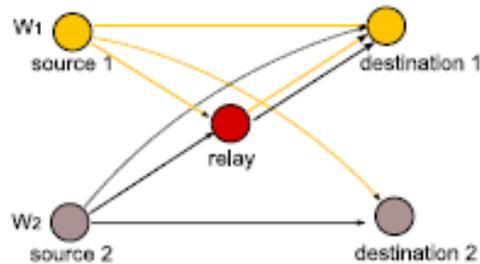

- **Many possible cooperation strategies:**
 - Virtual MIMO, relaying (DF, CF, AF), one-shot/iterative conferencing, and network coding
 - Nodes can use orthogonal or non-orthogonal channels.
 - Many practice and theoretical challenges
 - New full duplex relays can be exploited

General Relay Strategies

- Can forward message and/or interference
 - Relay can forward all or part of the messages
 - Much room for innovation
 - Relay can forward **interference**
 - To help subtract it out

Beneficial to forward both interference and message

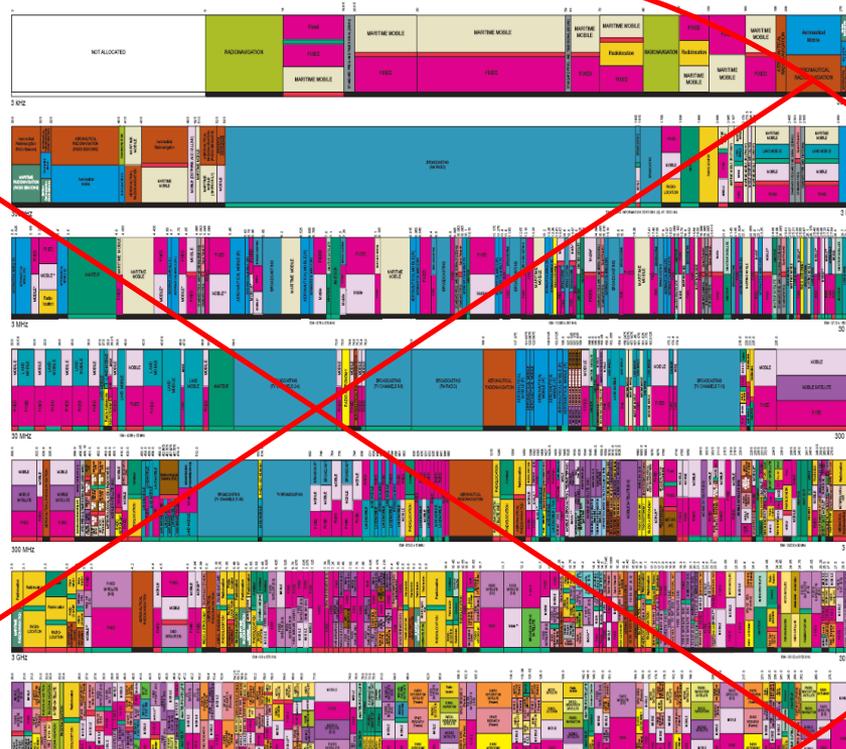

- For large powers, this strategy approaches capacity

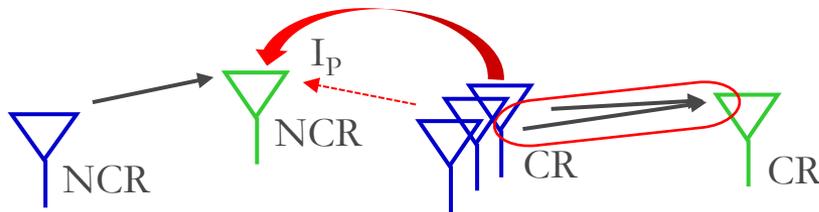

Spectrum innovations beyond licensed/unlicensed paradigms

Cognitive Radios

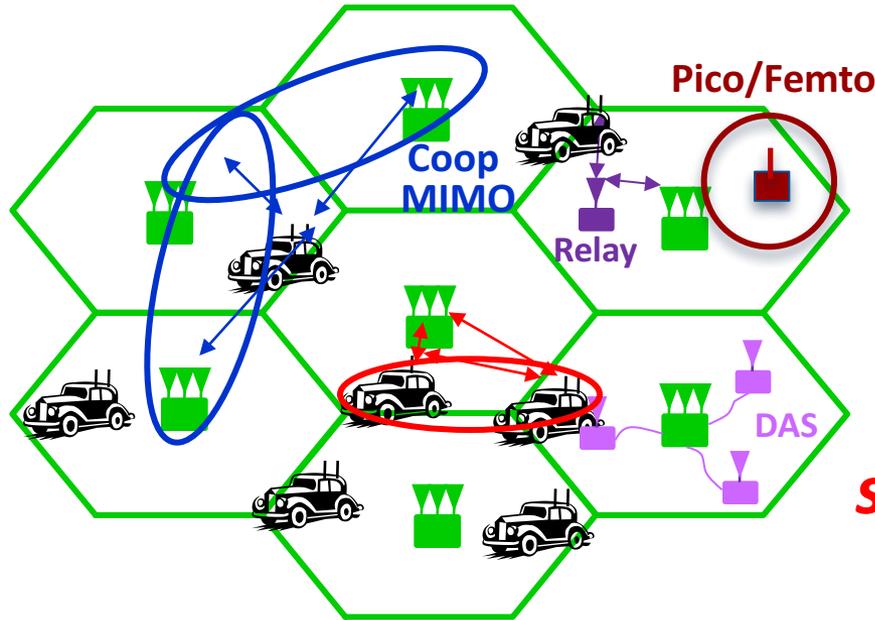

MIMO Cognitive Underlay

Cognitive Overlay

- **Cognitive radios support new users in existing crowded spectrum without degrading licensed users**
 - Utilize advanced communication and DSP techniques
 - Coupled with novel spectrum allocation policies
- **Multiple paradigms**
 - (MIMO) Underlay (interference below a threshold)
 - Interweave finds/uses unused time/freq/space slots
 - Overlay (overhears/relays primary message while cancelling interference it causes to cognitive receiver)

“Green” Wireless Networks

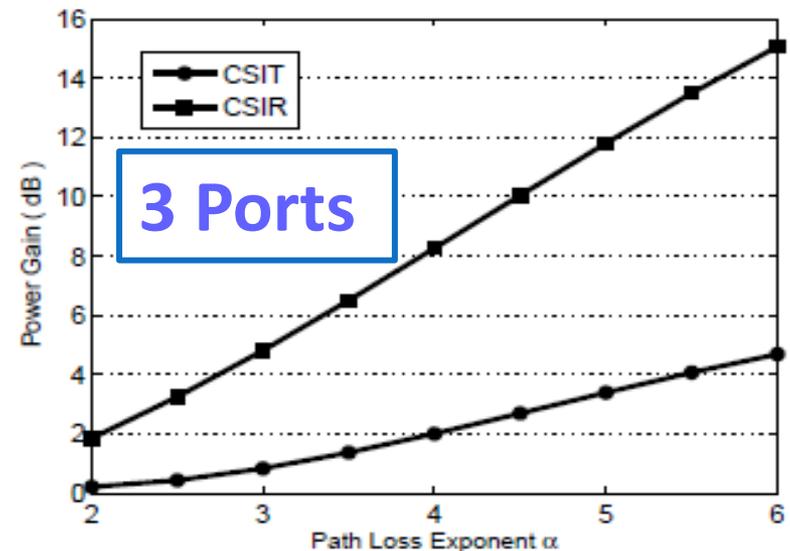

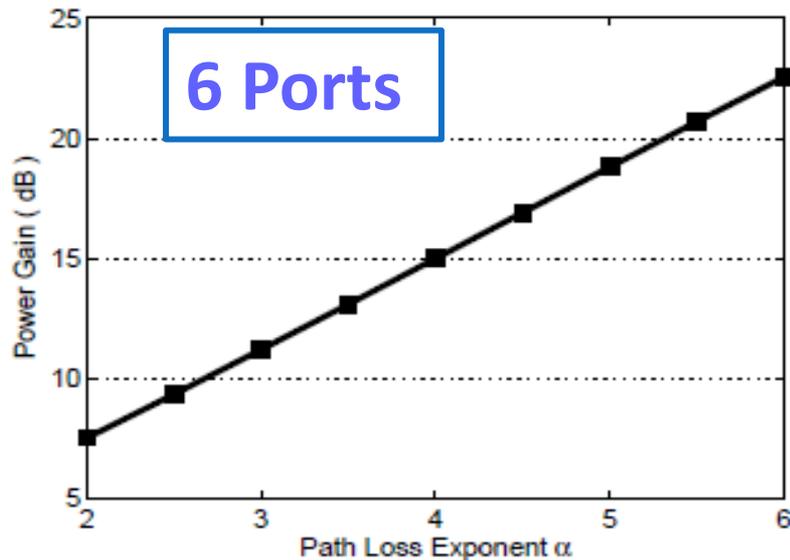

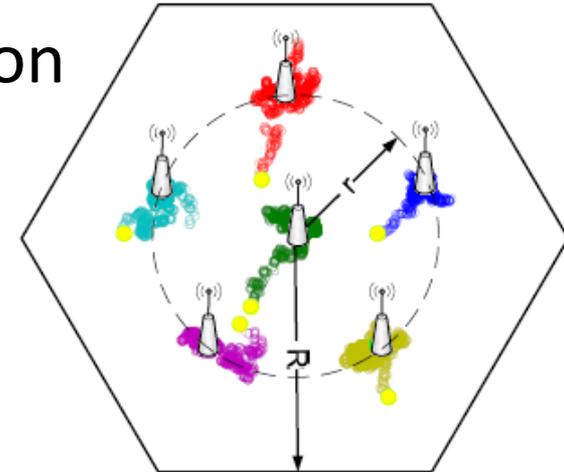

How should wireless systems be redesigned for minimum energy?

Research indicates that significant savings is possible

- Drastic energy reduction needed (especially for IoT)
 - New Infrastructures: Cell Size, BS/AP placement, Distributed Antennas (DAS), Massive MIMO, Relays
 - New Protocols: Coop MIMO, RRM, Sleeping, Relaying
 - Low-Power (Green) Radios: Radio Architectures, Modulation, Coding, Massive MIMO

DAS to minimize energy

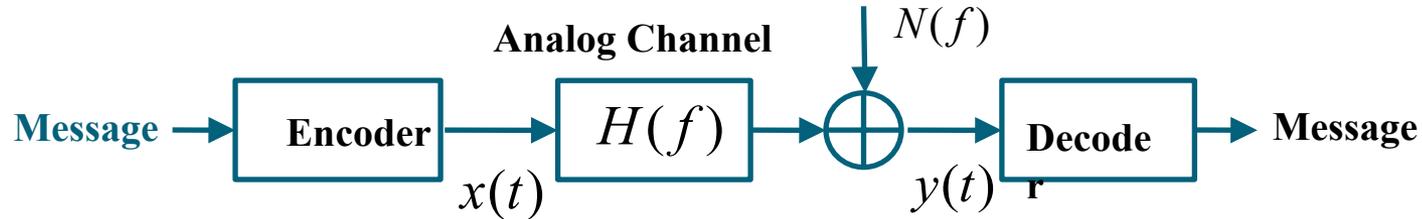

- Optimize distributed BS antenna location
- Primal/dual optimization framework
- Convex; standard solutions apply
- For 4+ ports, one moves to the center
- **Up to 23 dB power gain in downlink**
 - **Gain higher when CSIT not available**

Energy-Constrained Radios

- Transmit energy minimized by sending bits very slowly
 - Leads to increased circuit energy consumption
- Short-range networks must consider both transmit and processing/circuit energy.
 - Sophisticated encoding/decoding not always energy-efficient.
 - MIMO techniques not necessarily energy-efficient
 - Long transmission times not necessarily optimal
 - Multihop routing not necessarily optimal
- Sub-Nyquist Sampling

Sub-Nyquist Sampled Channels

C. Shannon

Wideband systems may preclude Nyquist-rate sampling!

H. Nyquist

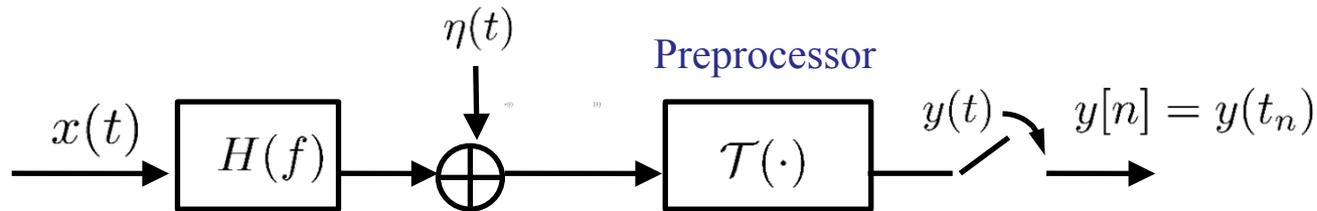

Sub-Nyquist sampling well explored in signal processing

- *Landau-rate sampling, compressed sensing, etc.*
- *Performance metric: MSE*

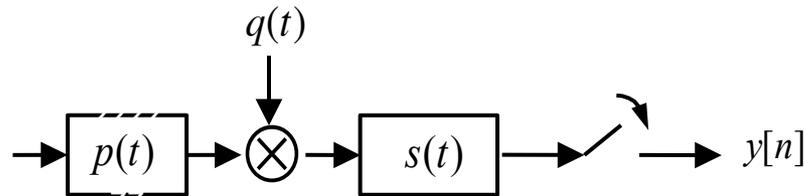

*We ask: what is the **capacity-achieving** sub-Nyquist sampler and communication design*

Capacity and Sub-Nyquist Sampling

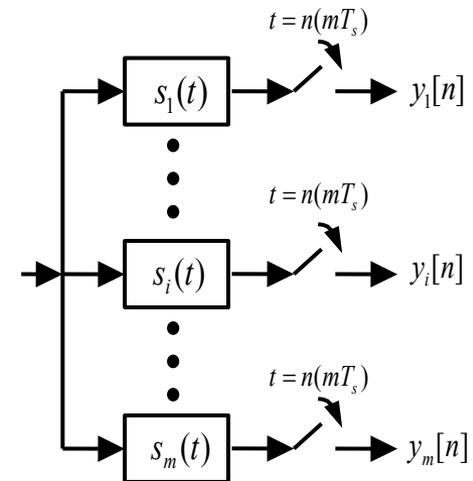

- Consider linear time-invariant sub-sampled channels

- Theorem: Capacity-achieving sampler

or

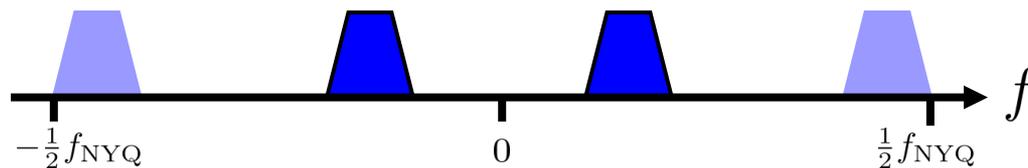

Optimal filters suppress aliasing

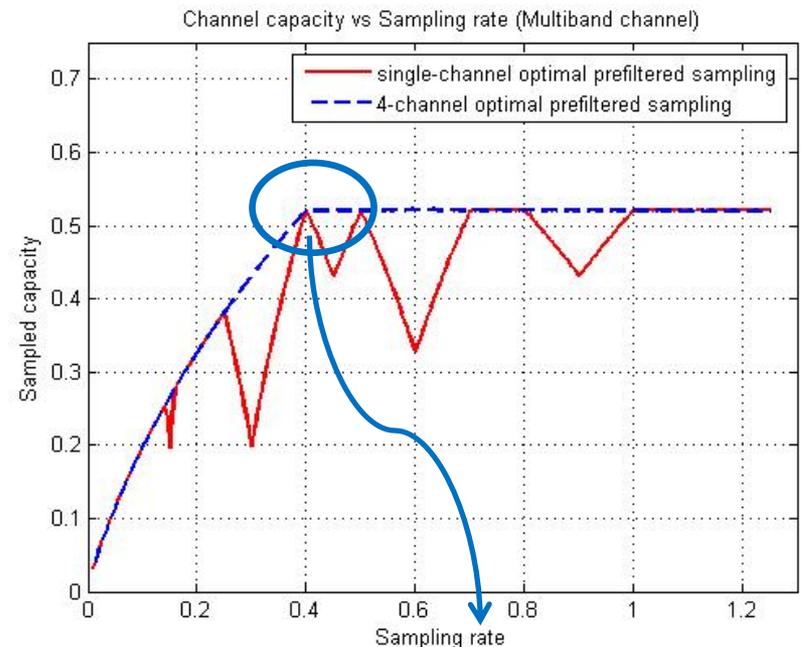

- Sub-Nyquist sampling is optimal for some channels!

Example: Multiband Channel

- Consider a “sparse” channel, and an optimally designed 4-branch filter bank sampler

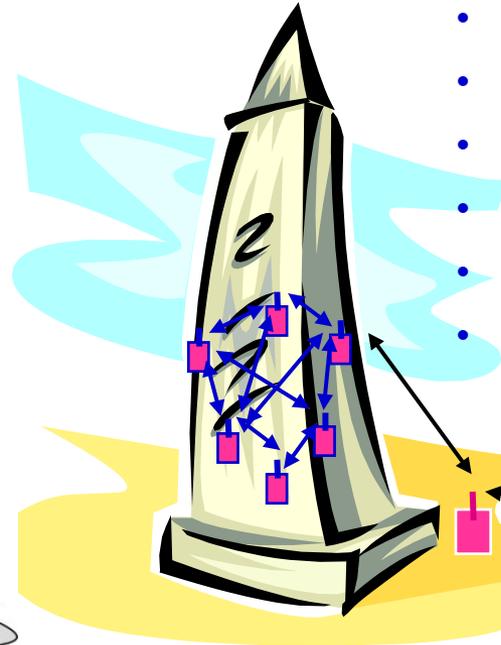

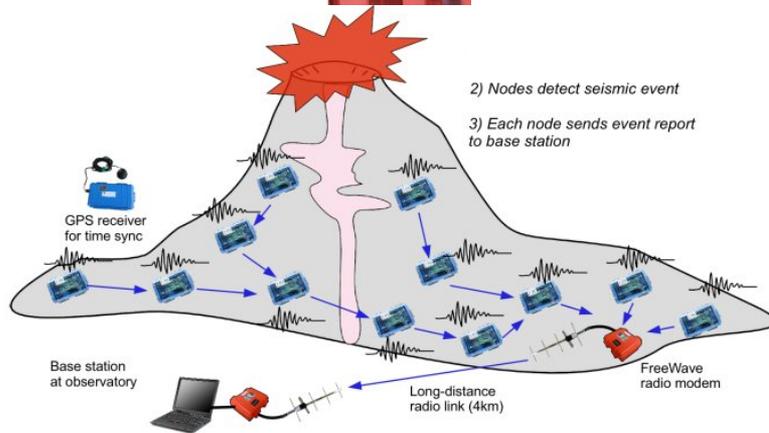

- Outperforms single-branch sampling.
- Achieves full-capacity above *Landau Rate*

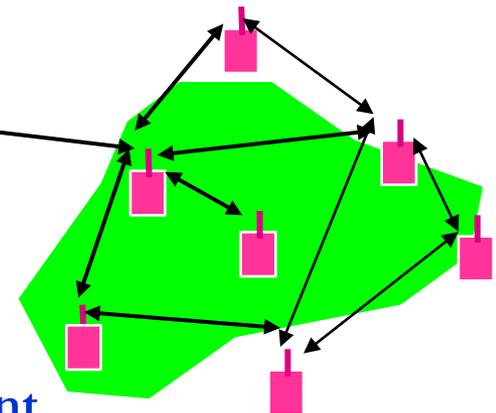

Landau Rate: sum of total bandwidths

Wireless Sensor Networks

Data Collection and Distributed Control

- Smart homes/buildings
- Smart structures
- Search and rescue
- Homeland security
- Event detection
- Battlefield surveillance

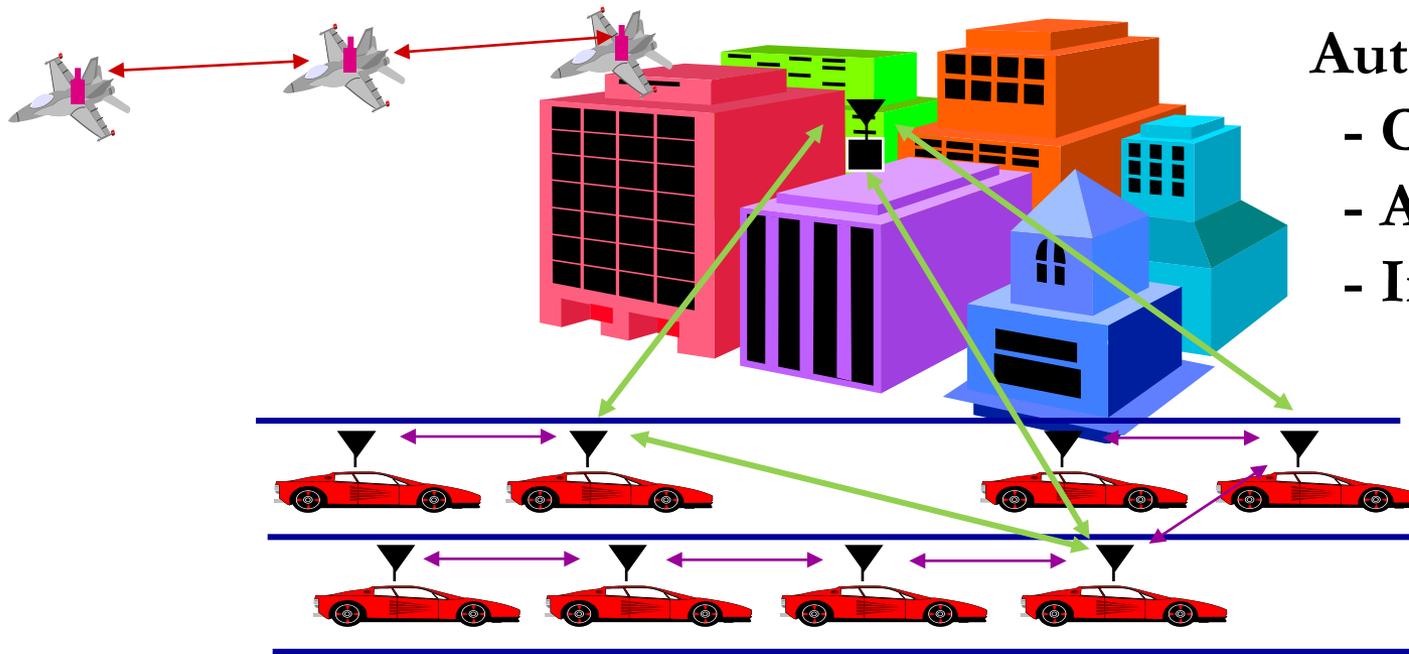

- **Energy (transmit and processing) is the driving constraint**
- **Data flows to centralized location (joint compression)**
- **Low per-node rates but tens to thousands of nodes**
- **Intelligence is in the network rather than in the devices**

Where should energy come from?

- **Batteries and traditional charging mechanisms**
 - Well-understood devices and systems
- **Wireless-power transfer**
 - Poorly understood, especially at large distances and with high efficiency
- **Communication with Energy Harvesting Radios**
 - Intermittent and random energy arrivals
 - Communication becomes energy-dependent
 - Can combine information and energy transmission
 - New principles for radio and network design needed.

Distributed Control over Wireless

Automated Vehicles

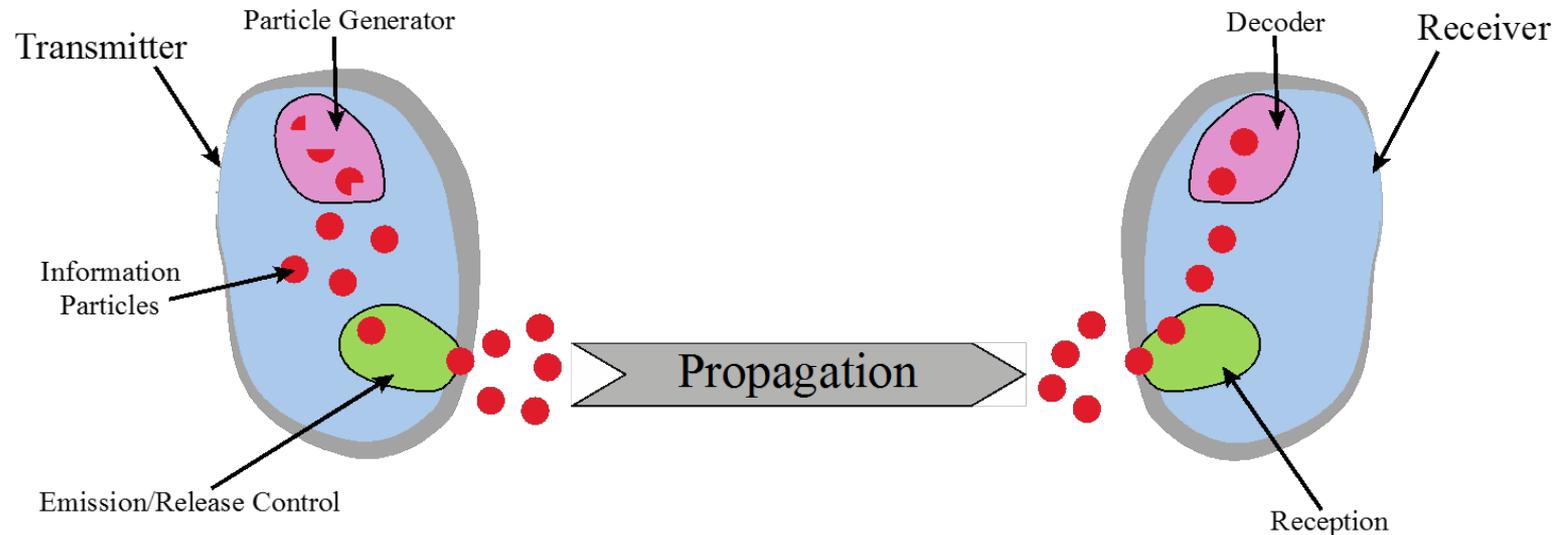

- Cars
- Airplanes/UAVs
- Insect flyers

Interdisciplinary design approach

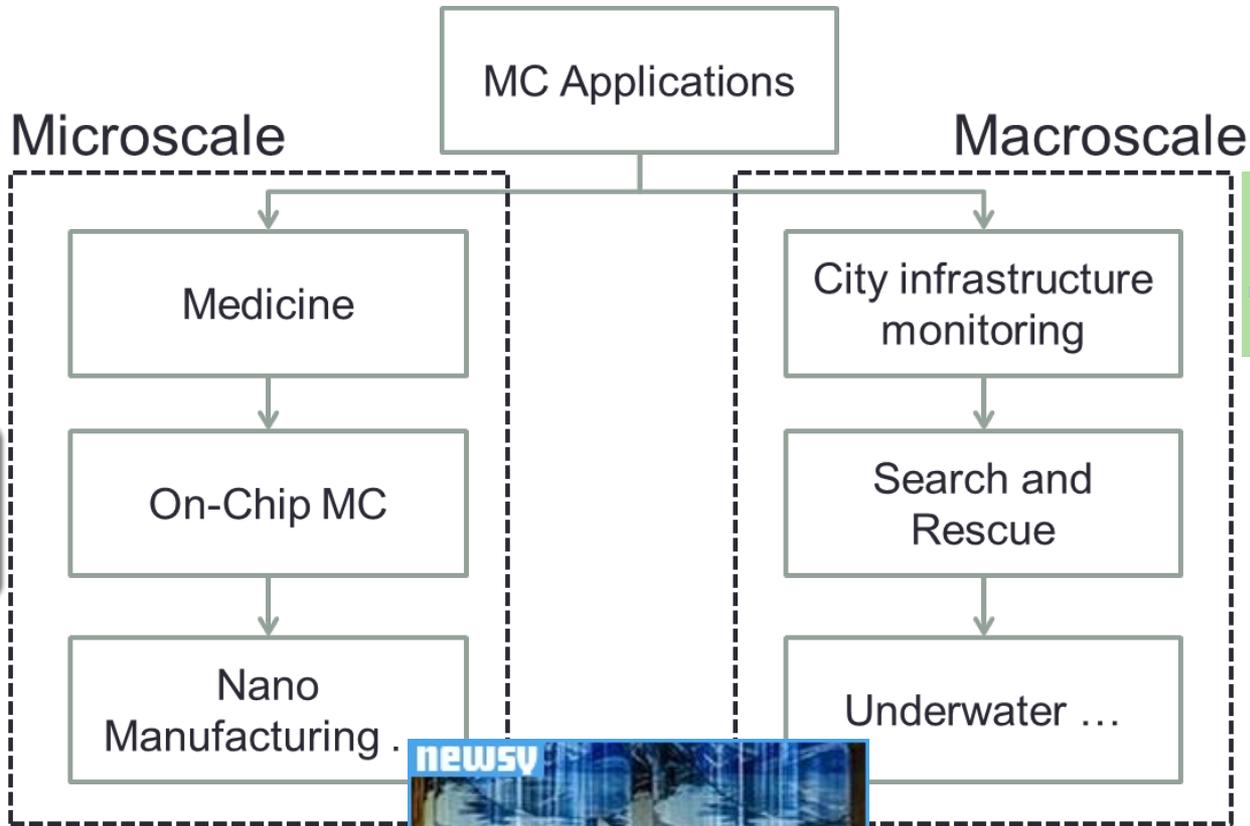

- Control requires **fast, accurate, and reliable** feedback.
- Wireless networks introduce **delay and loss**
- Need **reliable networks and robust controllers**
- Mostly open problems : *Many design challenges*

Chemical Communications

- Can be developed for both macro ($>cm$) and micro ($<mm$) scale communications
- Greenfield area of research:
 - Need new modulation schemes, channel impairment mitigation, multiple access, etc.

Applications

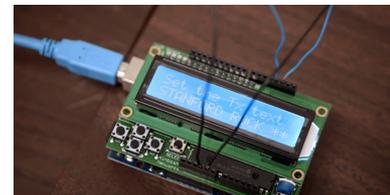

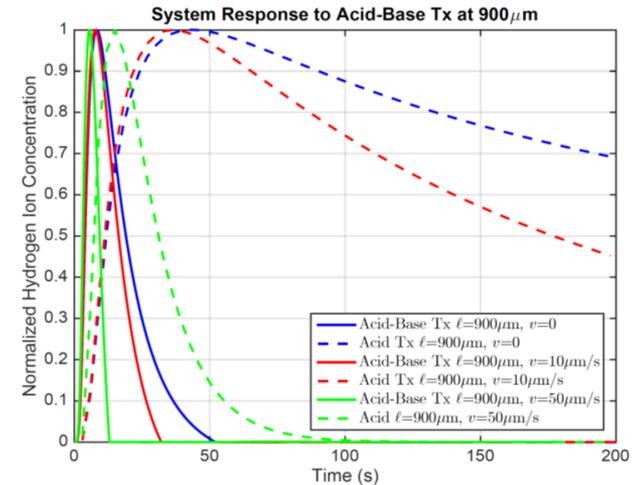

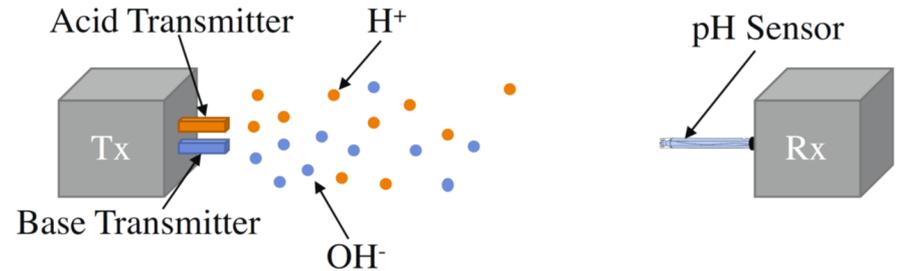

Data rate: .5 bps

“fan-enhanced” channel

Current Work

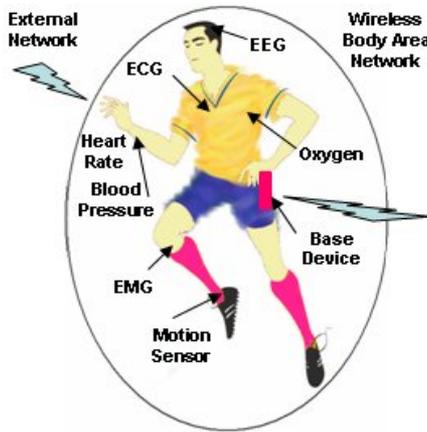

- Slow dissipation of chemicals leads to ISI
- Can use acid/base transmission to decrease ISI
- Similar ideas can be applied for multilevel modulation and multiuser techniques
- Currently testing in our lab
 - New equalization based on **machine learning**
 - Increased data rate 10x

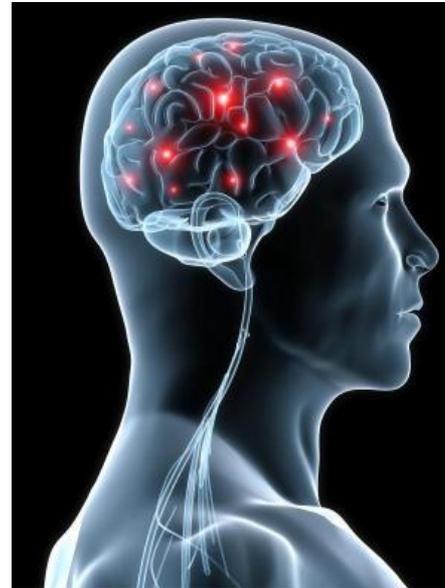

Sending text messages with windex and vinegar

Stanford Report:
November 15, 2016

Applications in Health, Biomedicine and Neuroscience

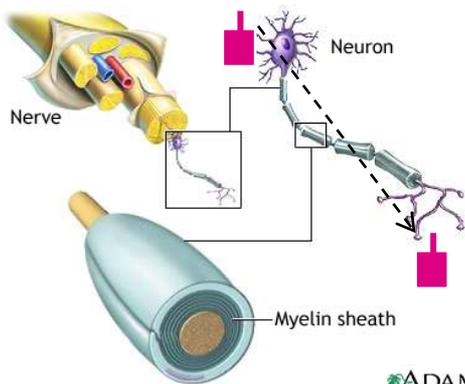

Body-Area Networks

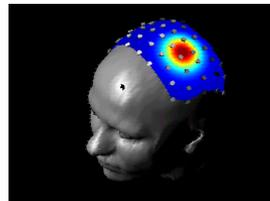

Neuroscience

- Nerve network (re)configuration
- EEG/ECoG signal processing
- Signal processing/control for deep brain stimulation
- SP/Comm applied to bioscience

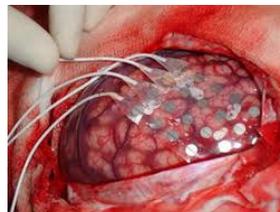

Recovery from Nerve Damage

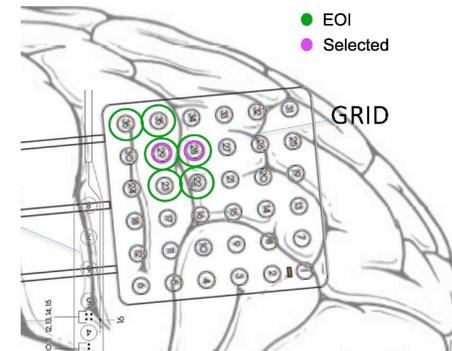

EEG

ECoG

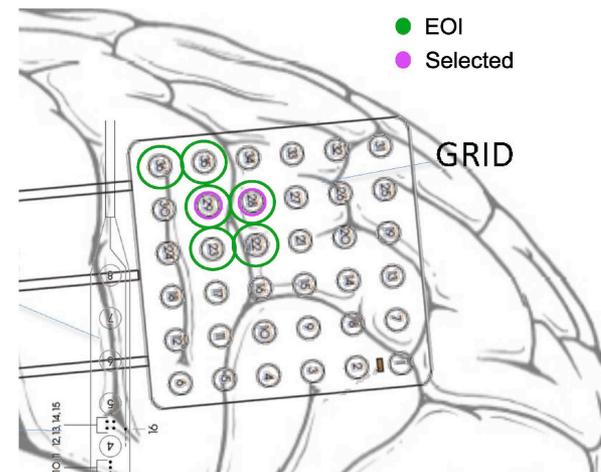

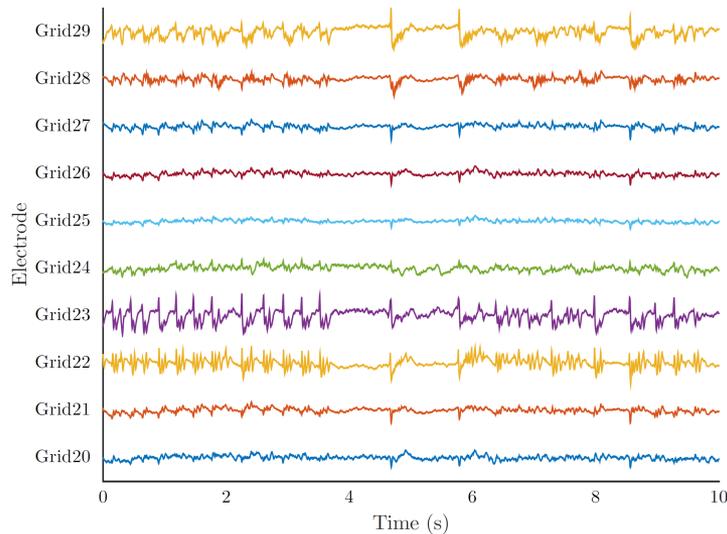

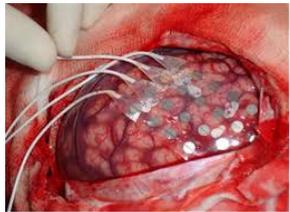

ECoG Epileptic Seizure Localization

Epileptic Seizure Focal Points

- Seizure caused by an oscillating signal moving across neurons
 - When enough neurons oscillate, a seizure occurs
 - Treatment “cuts out” signal origin: errors have serious implications
- Directed mutual information spanning tree algorithm applied to ECoG measurements estimates the focal point of the seizure
- Application of our algorithm to existing data sets on 3 patients matched well with their medical records

ECoG Data

Summary

- The next wave in wireless technology is upon us
 - This technology will enable new applications that will change people's lives worldwide
- Future wireless networks must support high rates for some users and extreme energy efficiency for others
 - Small cells, mmWave massive MIMO, Software-Defined Wireless Networks, and energy-efficient design key enablers.
- Communication tools and modeling techniques may provide breakthroughs in other areas of science

The End

- Thanks!!!
- Good luck on the final and final project
- Have a great winter break

Unless you are studying for quals – if so, good luck!
