Notes and reminders

- This is due on Mar 16, by 11:30 am. No late work will be accepted. (This is also the final due date for all late work.)
- You must submit your work electronically via Canvas.
- No collaboration of any kind is permitted. You are, though, free to use your notes and any other reference materials you like.
- Please submit questions on the Ed forum or to the staff email address. Questions sent to individual instructors probably won't be answered in a timely enough fashion to be useful.

1 Quantifiers, entailments, and implicatures [2 points]

A classic Gricean argument is that *most* is semantically consistent with *every* but tends to exclude it pragmatically because of a quality–quantity interaction. This argument depends on the semantic claim that *every* entails *most*. Your task is to support this claim, assuming the following meanings:

(M) \[ [\text{most}] = \lambda X \left( \lambda Y \left( \text{T if } |X \cap Y| > |X - Y|, \text{ else } F \right) \right) \]

(E) \[ [\text{every}] = \lambda X \left( \lambda Y \left( \text{T if } X \subseteq Y, \text{ else } F \right) \right) \]

In this context, a determiner meaning \( D_1 \) entails another determiner \( D_2 \) if and only if the following holds: if \( [D_1](A)(B) = \text{T} \), then \( [D_2](A)(B) = \text{T} \), for all \( A \) and \( B \). Assume throughout that the first argument to the determiner is non-empty.

2 Presuppositional quantificational determiner [2 points]

Keenan defines a quantified, presupposition-free version of *the* as follows:

(K) \[ [\text{the}] = \lambda X \left( \lambda Y \left( \text{T if } |X| = 1 \text{ and } X \subseteq Y, \text{ else } F \right) \right) \]

Convert this to a presuppositional quantificational determiner, on the model of our presuppositional treatment of *neither* and *both*. 
3 every and presuppositionality [2 points]

On Assignment 5, you gave a Gricean explanation for why it is generally odd for a speaker to say *every A B* if they know that \([A]\) is not true of any entities. An alternative analysis would be that *every* actually presupposes that \([A]\) is true of at least one entity. Your tasks:

i. Formulate this presuppositional *every* as a partial quantificational determiner meaning (same kind of meaning as, e.g., *neither*).

ii. Articulate what this analysis predicts about the monotonicity properties of *every*, and explain why it makes these predictions using a technical argument. For examples of technical arguments of this form, see handout ‘Some formal analyses of determiners’. Given the presuppositions involved here, it is worth being explicit that all the monotonicity definitions require preservation of truth, and flipping from T to ‘undefined’ is not preservation of truth.

4 What kind of meaning is this? [2 points]

The handout ‘Diagnosing different kinds of meaning’ provides a flow-chart for classifying meanings as variously at-issue, conventionally implicated, presupposed, or conversationally implicated. Use that framework to classify meaning *p* as expressed in (C).

(C) Sam confirmed that Carol ran the marathon.

\[ p = \text{Carol ran the marathon.} \]

Section 3 of the handout provides model answers. Your own answer could adopt the same format, and we’re looking for a similar level of explanation about the relevant examples.

5 Scalar adjective experimental predictions [2 points]

The adjective *empty* can be modified by maximal standard adverbs like *completely*, as in *completely empty*. In light of this, on the theory developed by Syrett et al. (2009), what is the expected pattern of behavior (for children and adults) for the prompt ‘Hand me the empty one’ in an experimental condition in which the subject is presented with two boxes, both partly full of toys, but one noticeably fuller than the other, and why is this the expected behavior on their theory? (2–3 sentence response.)

6 Illocutionary effects [2 points]

In *Speaking of Crime*, Solan and Tiersma observe that people in police custody often perform the speech act of invoking their right to counsel very indirectly, with utterances like “Maybe I need a lawyer”. Your task: using the properties of illocutionary force given in section 4.2 of the ‘Speech acts’ handout, give two reasons why people in custody might behave in this way. (There are a number of sensible reasons that connect with the illocutionary force properties. You can just pick two. We expect each reason to take 3–5 sentences to describe.)
7 Swearing and the FCC

Provide three cogent linguistic or cognitive arguments in favor of the position that swears like the F-word should be subject to different legal restrictions than other kinds of speech. (2–4 sentences per argument; the arguments might not be persuasive to you, but they should make sense!)
