

Linear Programming for Machine Learning

Yinyu Ye

Stanford University and CUHKSZ (Sabbatical Leave)

Currently Visiting CUHK and HK PolyU

<https://web.stanford.edu/class/msande211x/handout.shtml>

Read Chapter 1.1, 1.2, 2.1, 2.2, Appendices A, B&D
of the Text-Book

1st Day Questions

- Assistant Instructor: Zaikun Zhang

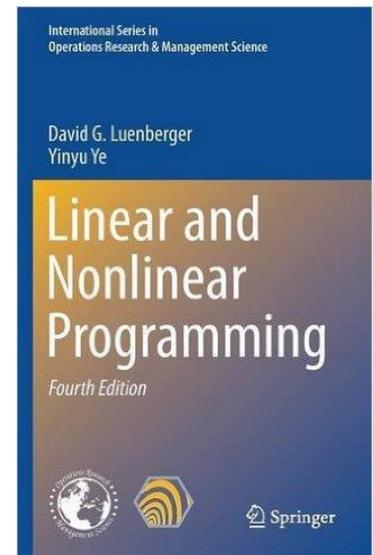

Websites:

<https://web.stanford.edu/class/msande211x/handout.shtml>

And

<https://web.stanford.edu/class/msande211x/assignment.shtml>

- Textbook: **Linear and Nonlinear Programming**
(LY 5th edition)
- Prerequisite: calculus and linear algebra classes
- The software use will help: Solvers in Matlab, R, Python or other public free software. It is mostly a “**PAPER AND PENCIL**” class!
- Form a “diversified” study/project group

Mathematical Optimization Model

- Often consider the common quantitative model of data/decision/management science & engineering:
 - Maximize or Minimize $f(\mathbf{x})$
for all $\mathbf{x} \in$ some set X
- Decision variables represented by a vector \mathbf{x} , Objective function $f(\mathbf{x})$, Constraint set X
- Applications in:
 - Applied Science, Engineering, Economics, Finance, Medicine, Statistics, Business
 - General Decision and Policy Making
- The famous Eighteenth Century Swiss mathematician and physicist Leonhard Euler (1707-1783) proclaimed that “...nothing at all takes place in the Universe in which some rule of maximum or minimum does not appear.”

The Prototypical Optimization Problem

Max (or Max):

$$f(\mathbf{x})$$

s.t. :

$$h_1(\mathbf{x}) = 0$$

...

$$h_m(\mathbf{x}) = 0$$

$$g_1(\mathbf{x}) \leq 0$$

...

$$g_r(\mathbf{x}) \leq 0$$

The Function could be:

$$x_1 + 2x_2, x^2 + 2xy + 2y^2, x \ln(x) + e^y, |x| + \max\{x, y\}, \text{ etc}$$

Linear Programming/Optimization: all functions are linear/affine

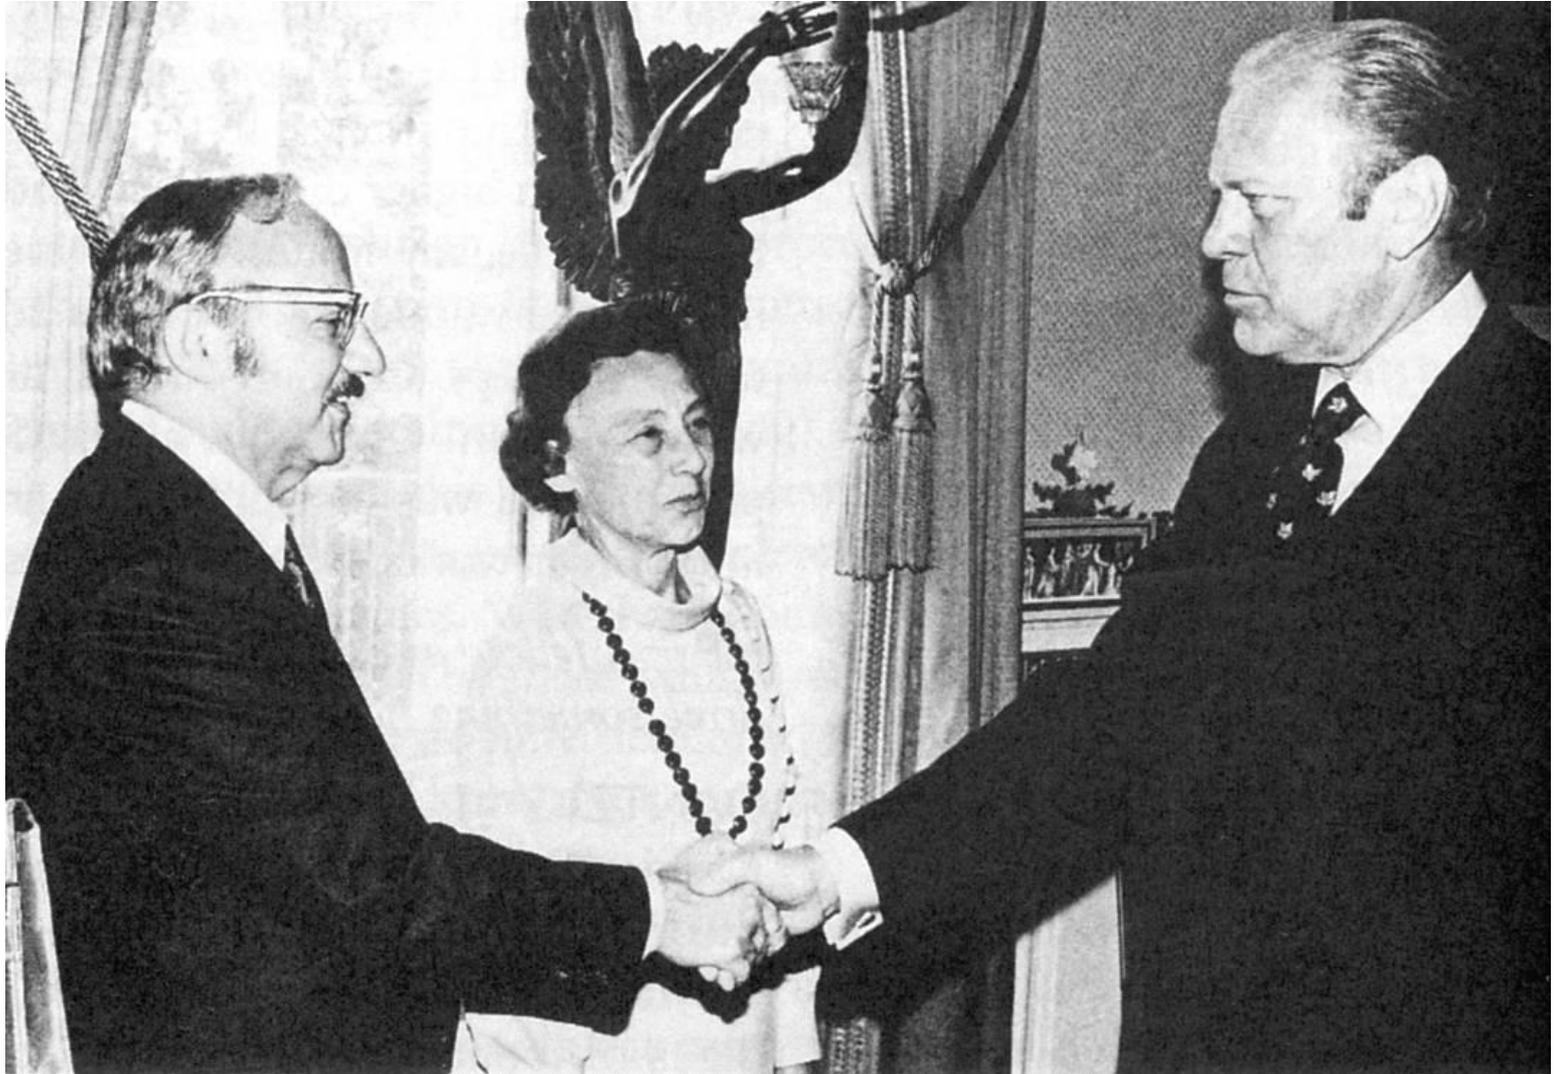

Linear Programming

- Why do we study LP's
 - Not just because solving non-linear problems are difficult
 - But also real-world Machine-Learning problems are often formulated as linear equations and inequalities
 - Either because they indeed are linear
 - Or because it is unclear how to represent them and linear is an intuitive compromise
 - A stepping stone for solving more complicated nonlinear optimization problems, which you would see later.

LP Giants won Nobel Prize...

... and National Medal of Science

Contents Covered in this Course

- **Linear Optimization** (Programming)
 - Model
 - Math Preliminaries
- **LP in Machine Learning**
 - Support Vector Machine
 - Information Markets
 - Wasserstein Barry Center
 - Reinforcement Learning

What do you learn?

- Models – **the Art: intuition and common sense**
 - How formulate real problems using quantitative models
- Little Theory – **the Science: theorems, geometries and universal rules**
 - Necessary and Sufficient Conditions that must be true for the optimality of different classes of problems.
- Applications – **AI, Machine Learning and Data Science**
 - SVM, the Wasserstein barycenter, Reinforced learning/MDP, Information market,...

Art of Modeling, Formulation & Vocabulary

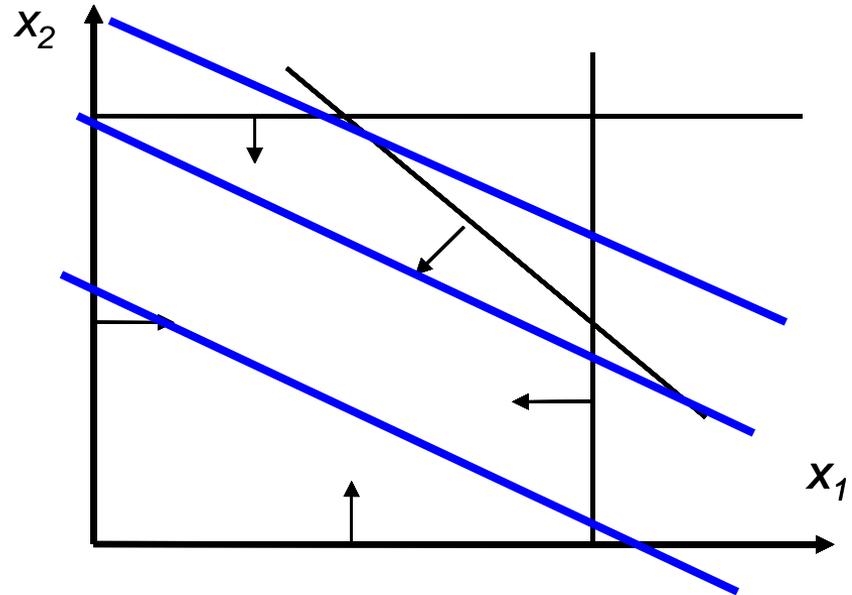

- Decision Variables $\mathbf{x} \in \mathbb{R}^n$, yet to be decide
- Data/Coefficients, $\mathbf{c} \in \mathbb{R}^n$, that are given and fixed
- Objective inner product $f = \mathbf{c}^T \mathbf{x}: \mathbb{R}^n \rightarrow \mathbb{R}$
- Constraint Set $X \subset \mathbb{R}^n$
- Feasible solution $\mathbf{x} \in X$
- Optimal solution $\mathbf{x}^* \in X^*$
- Optimal value $z^* = f(\mathbf{x}^*)$

LP Example 1: Resource Allocation/Production Management

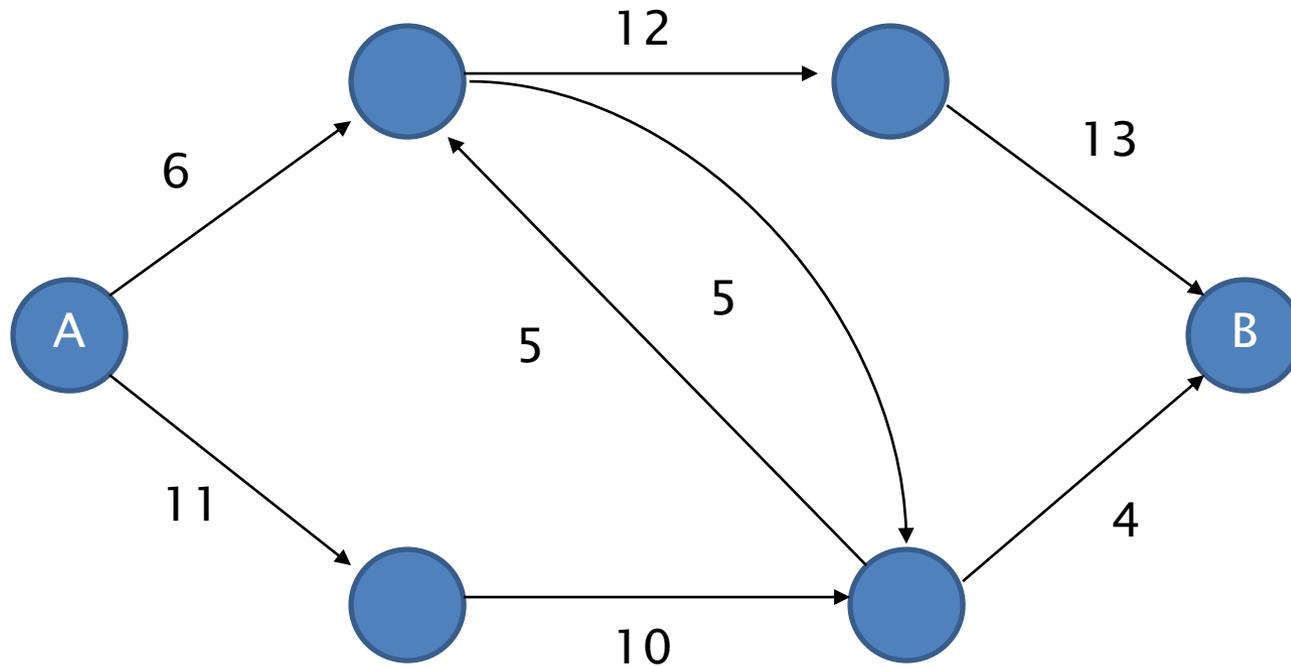

The Wyndor Glass Co. is a producer of high-quality glass **products**. It has three **plants**. Aluminum frames and hardware are made in Plant 1, wood frames are made in Plant 2, and Plant 3 is used to produce glass and assemble the products. Wyndor produces two products which require the **resources** of the three plants as follows:

Plant	Aluminum	Wood	Resources
1	1	0	100
2	0	2	200
3	1	1	150
Unit Profit	\$1000	\$2000	

$$\begin{array}{ll} \max & x_1 + 2x_2 \\ \text{s.t.} & x_1 \leq 1, \\ & 2x_2 \leq 2, \\ & x_1 + x_2 \leq 1.5, \\ & x_1, x_2 \geq 0 \end{array}$$

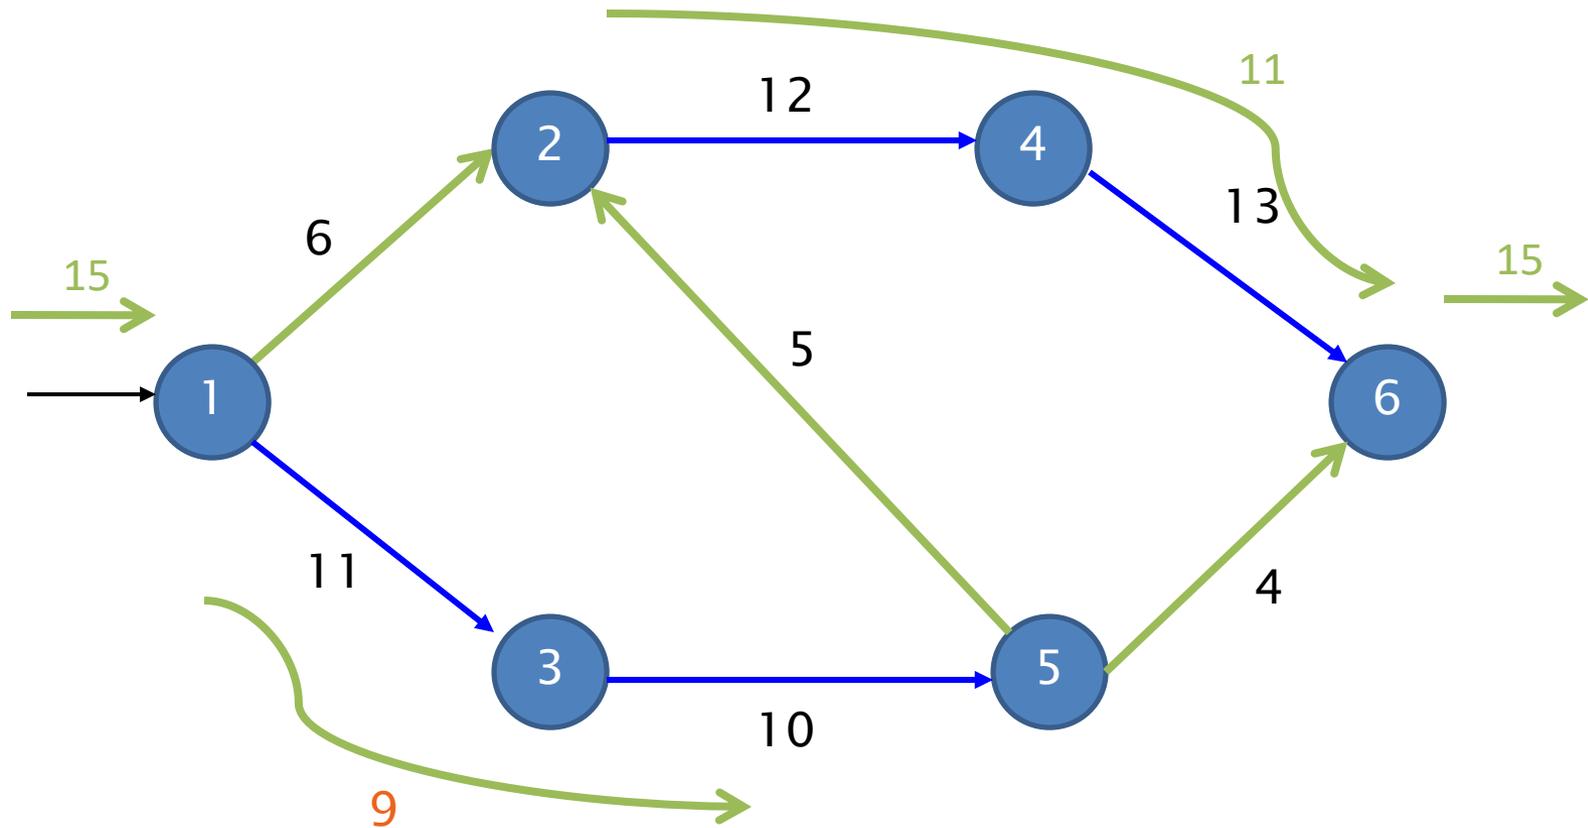

LP Example 2: Maximum Flow

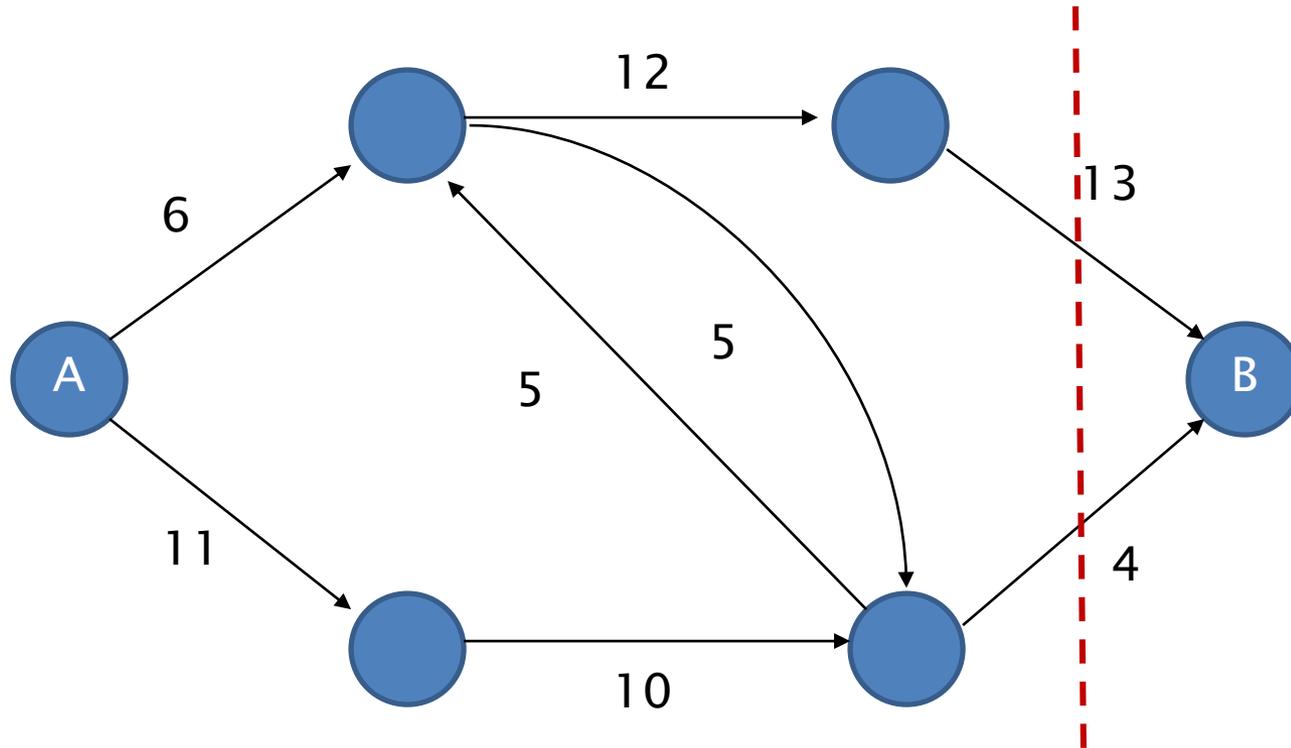

How much flow per unit time can travel from A to B, given that each of the directed connecting routes have flow limits/capacities?

Maximum Flow by Inspection

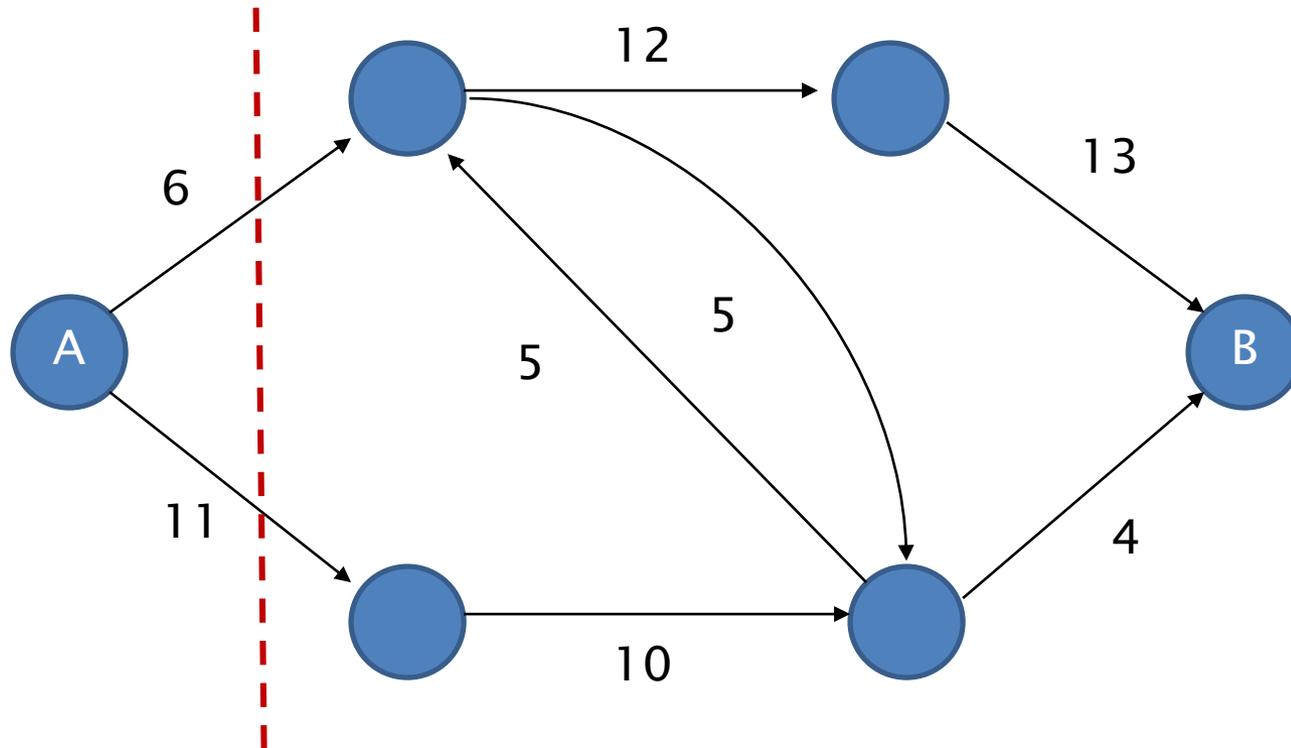

How to **certify** that 15 is maximal?

Cut in Maximum Flow I

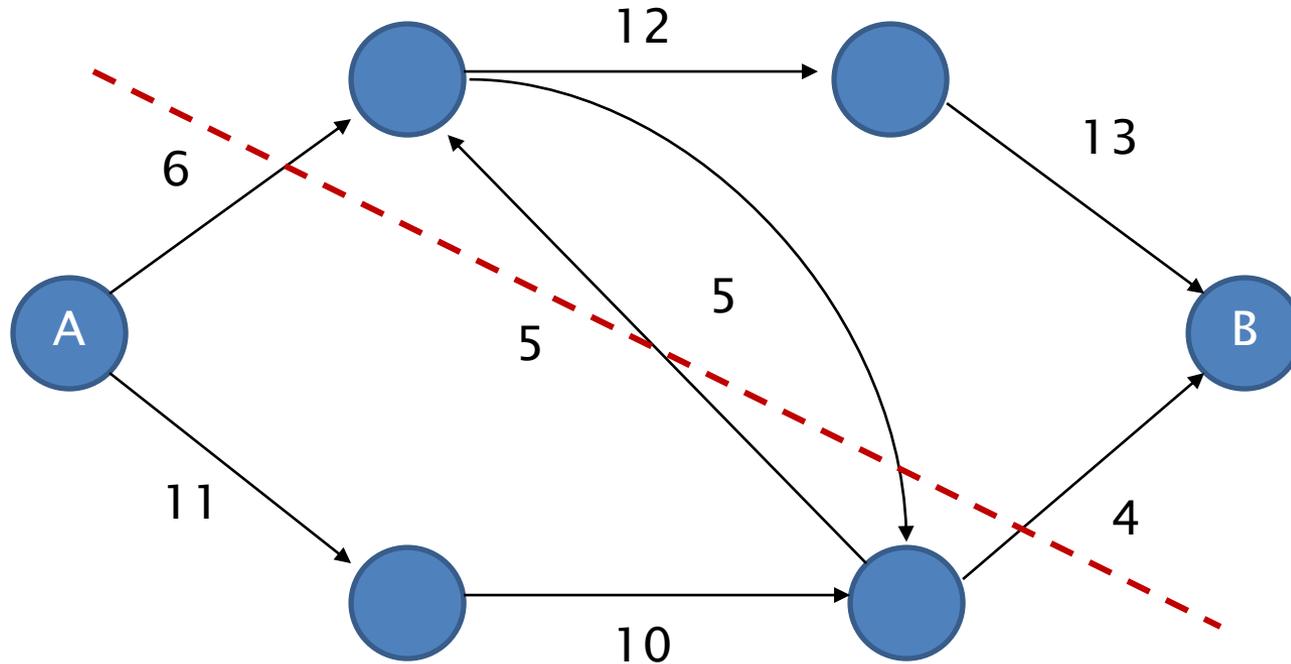

Cut value from Source site to Sink site=17

Cut in Maximum Flow II

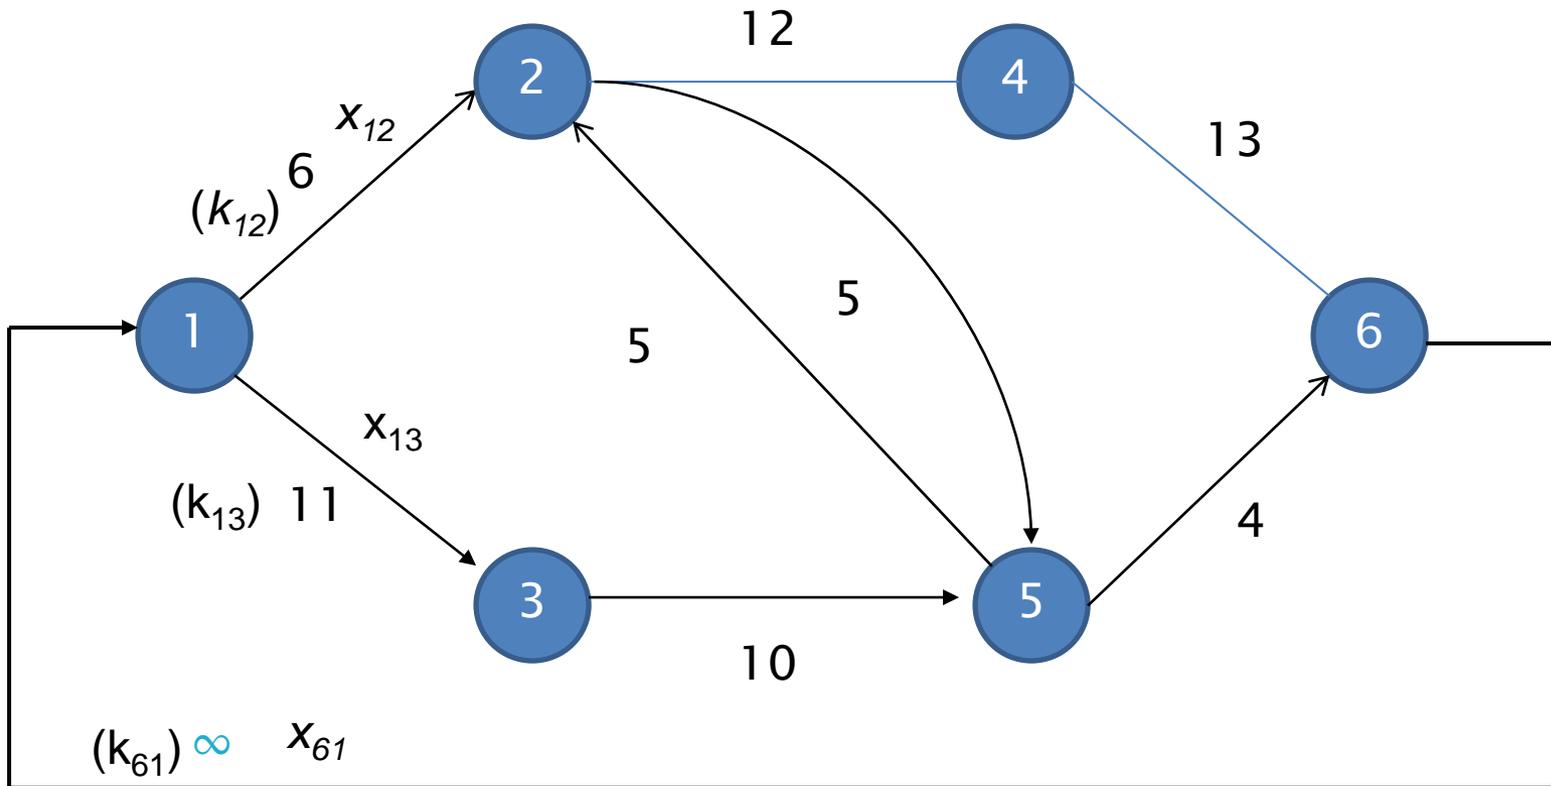

Cut value from Source site to Sink site=17

Cut in Maximum Flow III

Cut value from Source site to Sink site=15

Data points classification application in **Machine Learning and Data Science**

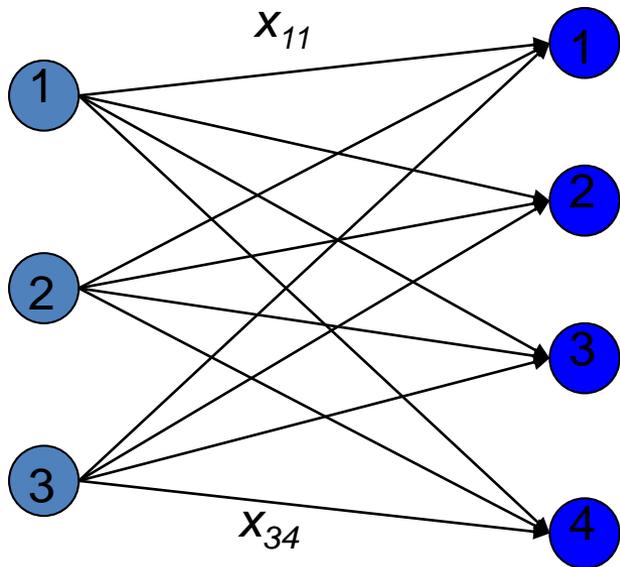

$$\begin{aligned}
 &\max && x_{61} \\
 &\text{s.t.} && \sum_k x_{ki} = \sum_j x_{ij} \quad \forall i = 1, 2, 3, 4, 5, 6 \\
 &&& 0 \leq x_{ij} \leq k_{ij} \quad \forall i, j = 1, 2, 3, 4, 5, 6
 \end{aligned}$$

Annotations: "inflow" points to the left side of the flow conservation equation, and "outflow" points to the right side.

LP Example 3: Transportation and Assignment

	Retailer 1	Retailer 2	Retailer 3	Retailer 4	SUPPLY
Warehouse 1	12 (c_{11})	13	4	6	500 (s_1)
Warehouse 2	6	4	10	11	700 (s_2)
Warehouse 3	10	9	12	14 (c_{34})	800 (s_3)
DEMAND	400 (d_1)	900 (d_2)	200 (d_3)	500 (d_4)	2000 (s_4)

$$\begin{array}{ll}
 \min & \sum_{i=1}^3 \sum_{j=1}^4 c_{ij} x_{ij} \\
 \text{s.t.} & \sum_{j=1}^4 x_{ij} = s_i, \quad \forall i = 1, 2, 3 \\
 & \sum_{i=1}^3 x_{ij} = d_j, \quad \forall j = 1, 2, 3, 4 \\
 & x_{ij} \geq 0, \quad \forall i, j
 \end{array}$$

Abstract Model

Inventory Planning: s is part of the decision vars.

Machine Learning: The Wasserstein Barycenter Problem I

The minimal transportation cost in Data Science is called the Wasserstein distance between a supply distribution and a demand distribution.

The **Wasserstein Barycenter Problem** is to find a distribution/points such that the sum of its Wasserstein distances to each of a set of distributions/points would be minimized

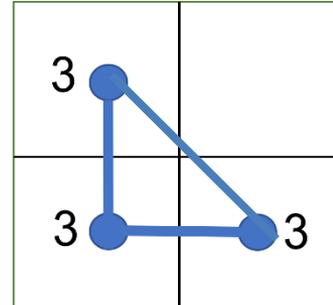

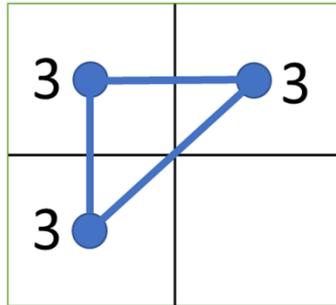

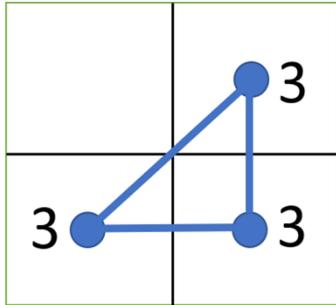

$$\min_s \sum_k \text{WD}(s, d^k) \text{ s.t. total mass constraint}$$

$$\text{WD}(s, d^k) = \min \sum_{i=1}^N \sum_{j=1}^N c_{ij} x_{ij}$$

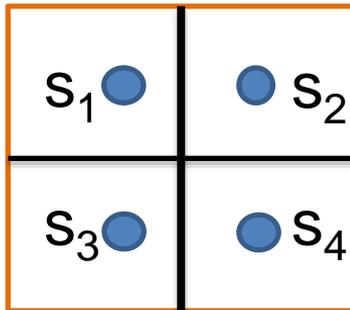

$$\text{s.t.} \sum_{j=1}^N x_{ij} = s_i, \quad \forall i = 1, \dots, N$$

$$\sum_{i=1}^N x_{ij} = d_j, \quad \forall j = 1, \dots, N$$

$$x_{ij} \geq 0, \quad \forall i, j$$

← Three possible demand distribution scenario of 4 cities

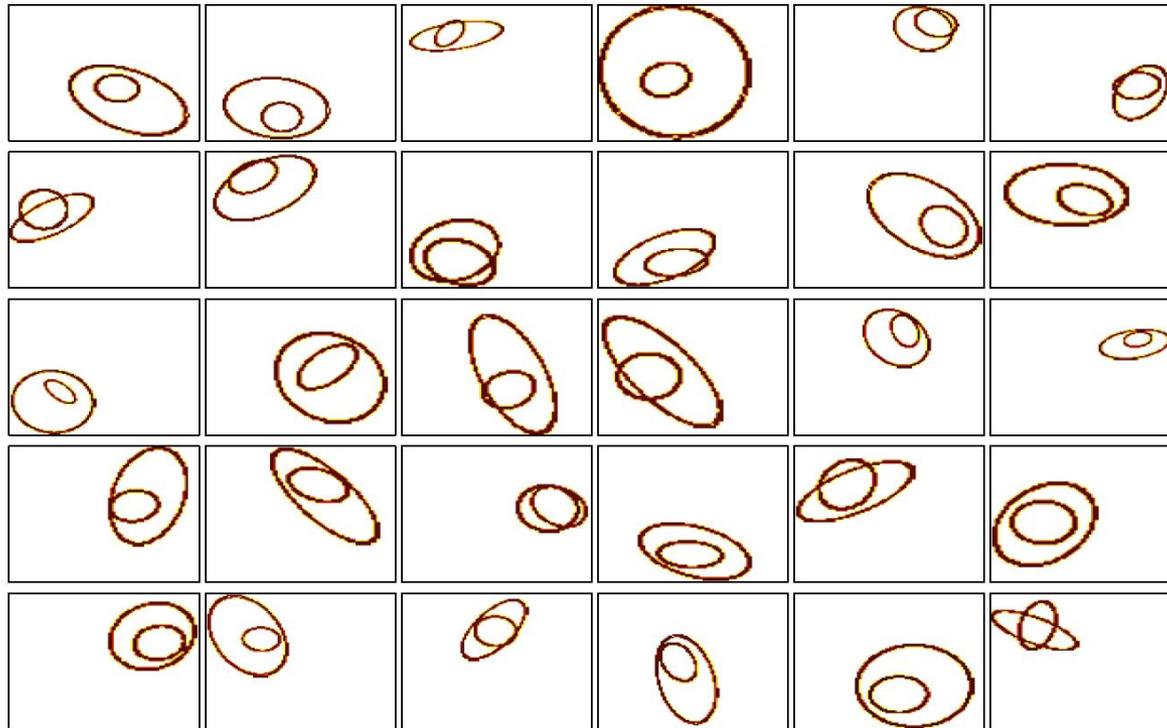

Constraints:

$$s_1 + s_2 + s_3 + s_4 = 9$$

$$(s_1, s_2, s_3, s_4) \geq 0$$

$$C = \begin{pmatrix} 0 & 1 & 1 & 2 \\ 1 & 0 & 2 & 1 \\ 1 & 2 & 0 & 1 \\ 2 & 1 & 1 & 0 \end{pmatrix}$$

Machine Learning: The Wassestein Barycenter Problem II

What is the best “mean or consensus” image from a set of images (pixel distributions)?

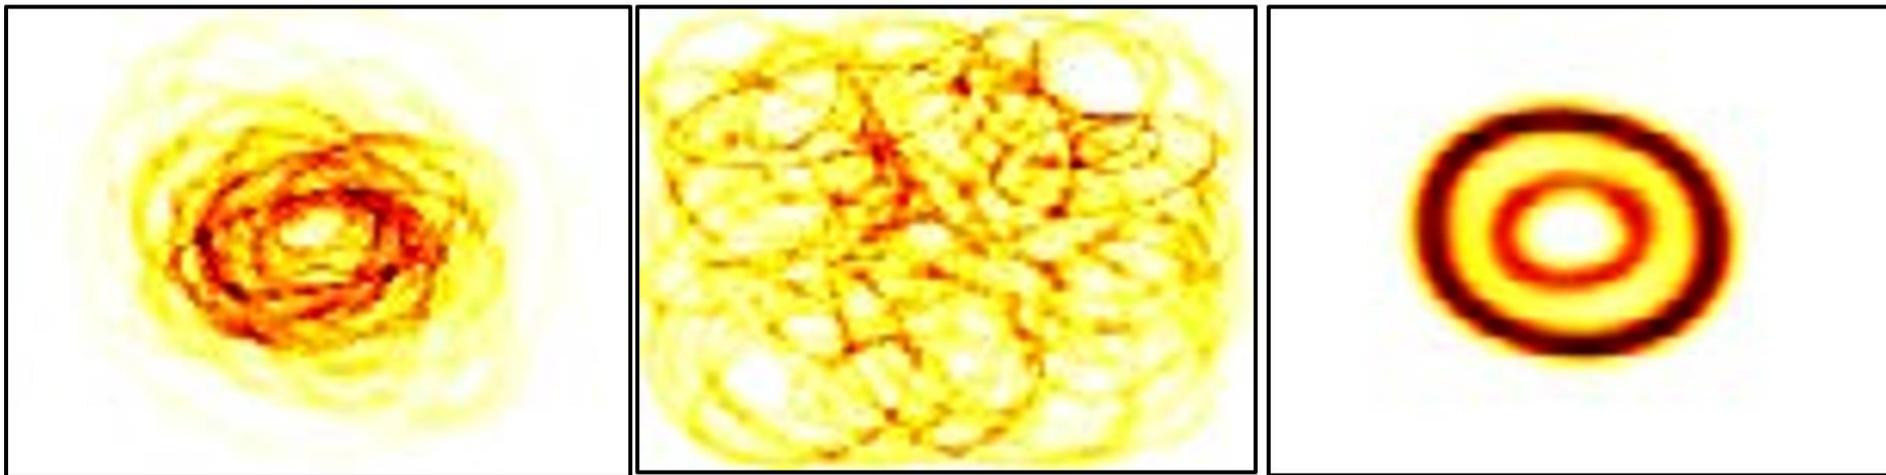

- Simple average
- Simple average after re-centering
- The Wasserstein Barycenter of the set of images (self re-center and rotation)

Machine Learning: The Wasserstein Barycenter Problem III

The simple average of n points is

$$\mathbf{s} = (\sum_k \mathbf{d}^k) / n \quad \text{or} \quad \min_{\mathbf{s}} \sum_k (\|\mathbf{s} - \mathbf{d}^k\|_2)^2$$

The **Wasserstein Barycenter Problem** is to find a distribution/points such that the sum of its Wasserstein distances to each of a set of distributions/points would be minimized (self re-center and rotation).

Simple average after re-centering

Simple average

the Barycenter image

LP Example 4: Electric Vehicle Charging Schedule and Inventory Control

	Period 1	Period 2	Period 3	Period 4	Period 5
Price (\$)	1.25 (c_1)	1.35 (c_2)	1.25 (c_3)	1.10 (c_4)	1.05 (c_5)
Demand (kw)	60 (d_1)	110 (d_2)	100 (d_3)	40 (d_4)	0 (d_5)
Charging (kw)	x_1	x_2	x_3	x_4	x_5
Inventory (I_0)	I_1	I_2	I_3	I_4	I_5

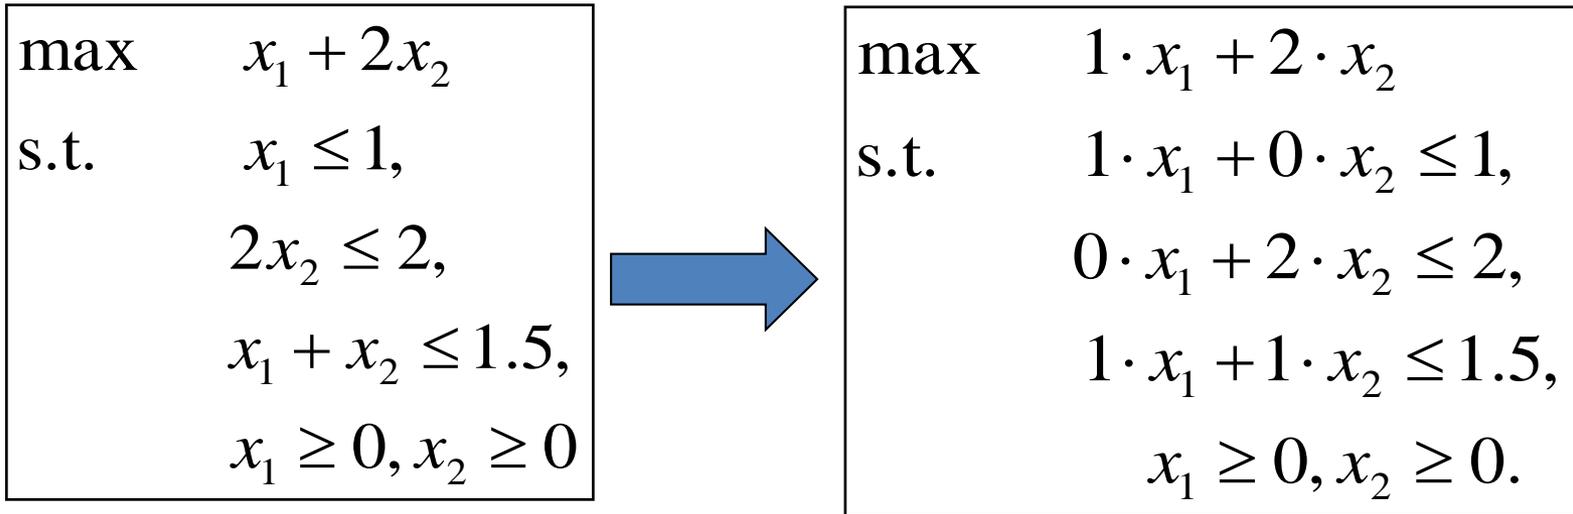

$$\begin{aligned}
 \min \quad & \sum_{i=1}^5 c_i x_i \\
 \text{s.t.} \quad & I_{i-1} + x_i - d_i = I_i, \quad \forall i = 1, 2, 3, 4, 5 \\
 & I_{i-1} + x_i \leq K, \quad \forall i = 1, 2, 3, 4, 5 \\
 & x_i \geq 0, I_i \geq 0, \quad \forall i.
 \end{aligned}$$

LP Example 4: When Discharge is Allowed

	Period 1	Period 2	Period 3	Period 4	Period 5
Price (\$)	1.25 (c_1)	1.35 (c_2)	1.25 (c_3)	1.10 (c_4)	1.05 (c_5)
Demand (kw)	60 (d_1)	110 (d_2)	100 (d_3)	40 (d_4)	0 (d_5)
Charging (kw)	x_1	x_2	x_3	x_4	x_5
Inventory (I_0)	I_1	I_2	I_3	I_4	I_5

$$\begin{aligned}
 \min \quad & \sum_{i=1}^5 c_i x_i \\
 \text{s.t.} \quad & I_{i-1} + x_i - d_i = I_i, \quad \forall i = 1, 2, 3, 4, 5 \\
 & I_{i-1} + x_i \leq K, \quad \forall i = 1, 2, 3, 4, 5 \\
 & I_i \geq 0, \quad \forall i.
 \end{aligned}$$

Linear Programming Abstract Form

$$\begin{array}{ll} \max & c_1 x_1 + c_2 x_2 \\ \text{s.t.} & a_{11} x_1 + a_{12} x_2 \leq b_1 \\ & a_{21} x_1 + a_{22} x_2 \leq b_2 \\ & a_{31} x_1 + a_{32} x_2 \leq b_3 \\ & x_1 \geq 0, x_2 \geq 0. \end{array}$$

Abstract Linear Programming Model

$$\max (\min) \quad c_1 x_1 + c_2 x_2 + \dots + c_n x_n$$

$$\text{s.t.} \quad a_{11} x_1 + a_{12} x_2 + \dots + a_{1n} x_n \{ \leq, =, \geq \} b_1$$

$$a_{21} x_1 + a_{22} x_2 + \dots + a_{2n} x_n \{ \leq, =, \geq \} b_2$$

... ..

$$a_{m1} x_1 + a_{m2} x_2 + \dots + a_{mn} x_n \{ \leq, =, \geq \} b_m$$

$$x_1 \geq 0, x_2^{\text{free}}, \dots, x_n \leq 0.$$

Input : c_1, \dots, c_n , objective coef.; b_1, \dots, b_m , constraint right - hand - side coef.

$a_{ij}, i = 1, \dots, m; j = 1, \dots, n$, constraint left - hand - side table or matrix coef.

Output : x_1, \dots, x_n , decision variables

LP in Compact Matrix Form

$$A = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}, b = \begin{pmatrix} b_1 \\ b_2 \\ \cdots \\ b_m \end{pmatrix}, c = \begin{pmatrix} c_1 \\ c_2 \\ \cdots \\ c_n \end{pmatrix}, x = \begin{pmatrix} x_1 \\ x_2 \\ \cdots \\ x_n \end{pmatrix}$$

↑
Coefficient matrix

↑
RHS vector

↑
Obj. vector

↑
decision vector

$$\max(\min) \quad c^T x$$

$$\text{s.t.} \quad A x \{ \leq, =, \geq \} b,$$

$$x \{ \geq, \leq \} 0 \text{ or free.}$$

Some Facts of Linear Programming

- Add a constant to the **objective function** does not change the optimality
- Scale the **objective coefficients** does not change the optimality
- Scale the **right-hand-side coefficients** does not change the optimality but the solution scaled accordingly
- **Reorder the decision variables** (together with their corresponding objective and constraint coefficients) does not change the optimality
- **Reorder the constraints** (together with their right-hand-side coefficients) does not change the optimality
- Multiply both sides of an **equality constraint** by a constant does not change the optimality
- Pre-multiply both sides of **all equality constraints** by a non-singular matrix does not change the optimality
