

The damage functions in models that compute the Social Cost of Carbon

David Anthoff

University of California, Berkeley

Samuelson condition

x = emission abatement

MC = marginal cost of abatement

MB_i = marginal benefit of abatement to person i

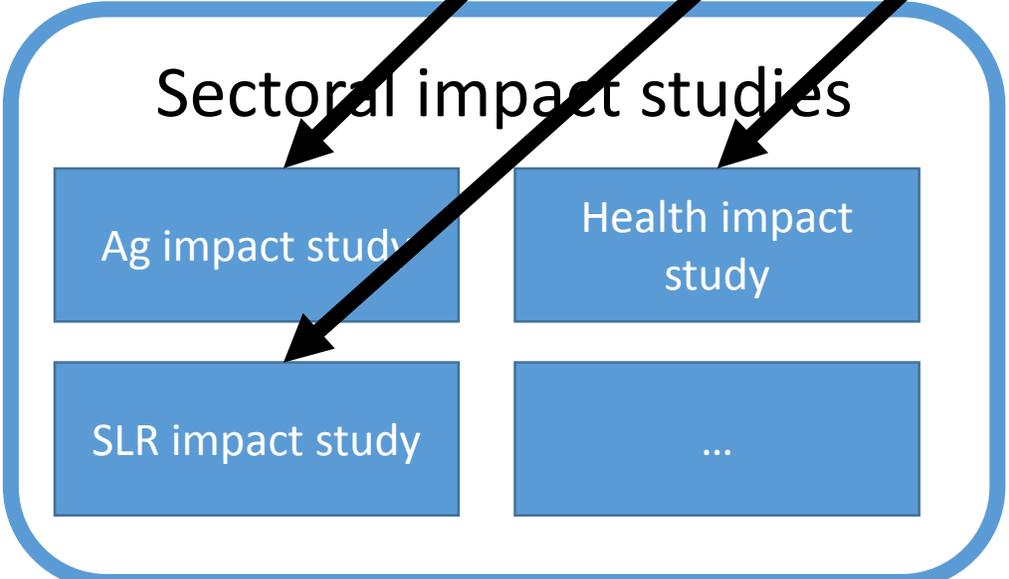

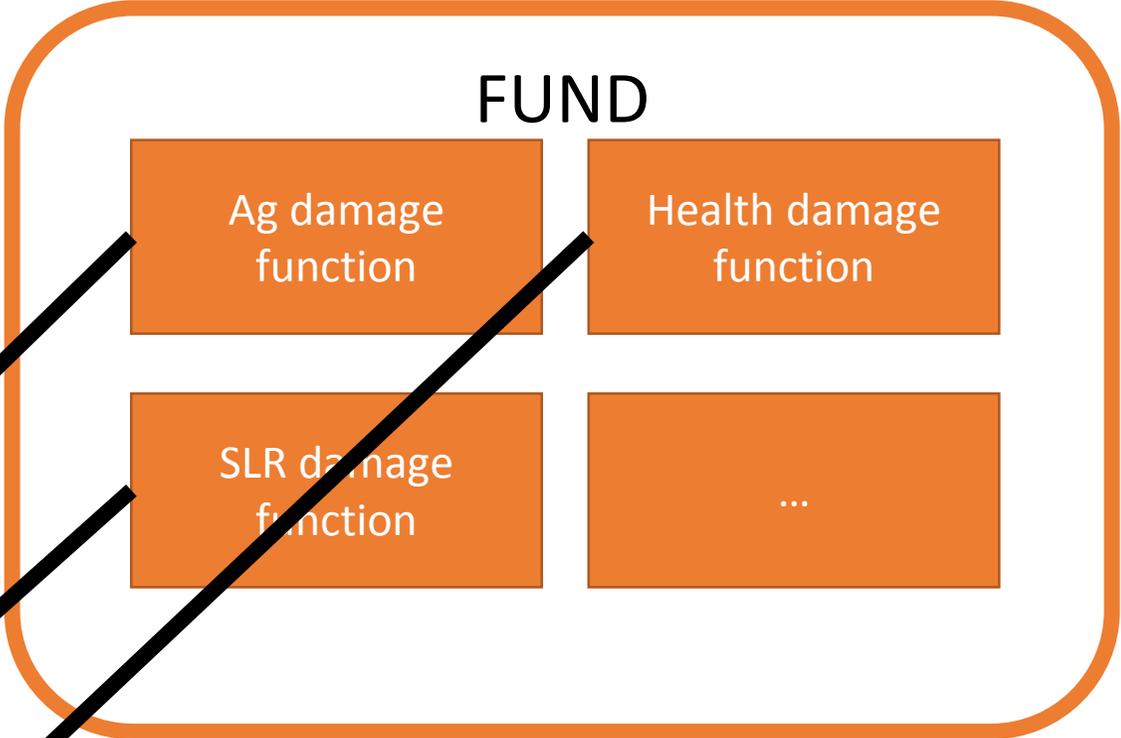

$$MC(x) = \sum_i MB_i(x)$$

Social Cost of Carbon

$$MB_i = \sum_s MB_{is}(x)$$

$$D(T) = \beta_1 T + \beta_2 T^2$$

“[...] The bottom line here is that the damage functions used in most IAMs are completely made up, with no theoretical or empirical foundation. [...]” (Pindyck, 2013)
