Preparing for Installation

As you prepare to install a LifeSize video communications system, consider the physical conditions of the room, compatibility with displays and your network configuration and settings. LifeSize recommends you collect your network settings and system identification information before you begin installation. Refer to “Initial Configuration” on page 6, which explains what information you need to collect and provides space to record it.

Room Configuration

The size, shape, layout and occupancy of the room dictate where you place your video conferencing components. For example, in a multi-user conference room, place a LifeSize MicPod or LifeSize Phone at the center of the participants as their detection patterns are omnidirectional.

Warning:  Avoid routing cables from the codec across foot-traffic areas as tripping on the cables can cause both personal injury and permanent damage to the connectors in the cables and codec. If cables must cross foot-traffic areas, use some form of cable management system or strategy to avoid the possibility of tripping.

The lighting in your environment affects image quality. The optimal lighting for LifeSize systems is 300 to 500 LUX. If light levels are too low, consider adding artificial lighting. Indirect light from shaded sources or reflected light from pale walls often produces excellent results. Avoid the following:

• direct sunlight on the subject matter, the background, or the camera lens
• direct illumination of the subject matter and camera lens
• colored lighting
• harsh side lighting or strong light from above

Consult your administrator or LifeSize Partner for specific lighting requirements for your environment.
Supported Display Types and Resolutions
LifeSize video communications systems connect to HD displays (720p minimum), including:

- Plasma, LCD, and LED flat panel displays
- Large screen rear projection TV displays (720p/1080p displays)
- Front projection displays
- Rear projector A/V room configurations

Supported display resolutions include the following:

Display 1:
- 1280 x 720p60
- 1280 x 768p60
- 1920 x 1080p30
- 1920 x 1080i60

Display 2:
- 1280 x 720p60
- 1280 x 768p60
- 1920 x 1080p30
- 1920 x 1080i60

The primary output of LifeSize Room 220 defaults to 720p60 and will work with any 720p HDMI display. To learn how to change the resolution for 1080 HDMI displays, refer to “Changing Display Resolution” on page 18.

Note: The Display 1 Resolution and Display 2 Resolution preferences in Administrator Preferences : Appearance : Displays default to Auto if you select an option for these preferences that is not supported by the connected display. For more information about troubleshooting exceptions to this behavior and changing display resolution, refer to “Changing Display Resolution” on page 18.

LifeSize recommends using a dual display configuration for presentations.

Note: If the resolutions are not the same, Display 2 will be limited to displaying presentations and will not be able to mirror the primary display or display calls. For more information, see “Configuring a Second Display” on page 19.
Placement Behind a Firewall

LifeSize recommends that you place your system behind a firewall and block, at minimum, the following ports:

- 22 (SSH)
- 23 (Telnet)
- 80 (HTTP)
- 443 (HTTPS)

If you require these ports to remain open, ensure that you change the default administrator and command line interface passwords to be very secure. For information about changing the default administrator password, refer to “Changing the Administrator Password” in the LifeSize Video Communications Systems Administrator Guide.

You can also disable SSH and web access on the system by configuring preferences in the user interface. By default, Telnet access is disabled. For more information, refer to the LifeSize Video Communications Systems Administrator Guide.

Network Bandwidth

Poor audio and video quality may result from insufficient bandwidth on your network. LifeSize recommends that your network be capable of at least 1 Mb/s (incoming and outgoing) for a high definition video call. During video calls with lower bandwidths, LifeSize systems automatically select the best resolution that can be achieved with the available bandwidth.

Domain Name Service Server

If you intend to use domain addresses for placing calls you must configure a Domain Name Service (DNS) server, or use a Dynamic Host Configuration Protocol (DHCP) server that automatically sets a DNS server.
Initial Configuration

During the installation process, your LifeSize system prompts you to configure it for the first time. LifeSize recommends that you gather all the necessary information prior to installation. The following sections provide guidelines for collecting and a means of recording this data. You may need to consult your network administrator for network settings and system identification information.

Note: The initial configuration screens also appear when you perform a system reset. For more information, refer to “Restoring Default Settings” in the LifeSize Video Communications Systems Administrator Guide.

Language

You can select the language to display in the user interface. The default is English.

Administrator and User Passwords

Some functions and preferences available from the user interface are accessible only to administrative users with a password. For security reasons, LifeSize recommends that you change the default administrator password (1 2 3 4) during the initial configuration.

Optionally, you can set a user password to control access to user preferences that enable the user to do the following:

- Change the appearance of the user interface.
- Specify how calls are answered.
- Configure audio settings.
- Change cameras and DVI-I input settings.
- Reboot the system.

The administrator and user passwords can contain any combination of the numbers 0-9 and the symbols * (star) and # (pound) up to 16 characters in length.

Note: If you set a user password, you can also use the administrator password to access user preferences.

Administrator Password: ________________________________________________
User Password: _______________________________________________________

LifeSize Room 220 Installation Guide
System Identification

Information that identifies the system to users appears throughout the user interface.

Set the **Location** preference to your location. The default is the United States. The **Time Zone** preference sets the system time that appears in the status bar on the main page of the user interface. It defaults to Greenwich Mean Time. You must set this preference even if you specify an NTP server during the initial configuration (refer to “Network Settings” on page 8).

The **System Name**, **Video Number**, and **Voice Number** appear in the user interface on the main screen. The system name may also appear in the local and corporate directories. LifeSize recommends that you change the default system name to one that meaningfully identifies the system to your users.

System Name: (to identify this installation in the network): _______________________

Video Number: ________________________________________________________

Phone Number: ________________________________________________________

Video and Voice Dialing Preferences

LifeSize systems support either the IP or ISDN protocol for video dialing. The default setting for the **Video Dialing** preference is **Auto** which enables the system to determine the best method to use to place calls.

You can select either **VoIP**, **ISDN**, or **Touch Tone** for the **Voice Dialing** preference. For voice calls, **VoIP** uses H.323 or SIP, **Touch Tone** uses PSTN. The default is VoIP.

**Note:** Pulse dialing is not supported.

When placing a call using the **Voice** button on a LifeSize Phone connected to the system and voice dialing is set to touch tone, you can only dial phone numbers using PSTN connectivity. When voice dialing is set to VoIP, you can dial IP addresses as well as phone numbers.

When placing a call using the remote control or using the **Video** button on the phone you can dial either phone numbers or IP addresses. This enables systems inside a corporate network without access to a gateway to call other LifeSize systems in the network using system IP addresses.
Network Settings

By default, DHCP is enabled on LifeSize systems. If you choose Disabled for the DHCP preference, you must enter an IP address (the locally configured IP address if not assigned by a DHCP server), Subnet Mask (used to partition the IP address into a network and host identifier), and Default Gateway (the IP address of the default gateway the system uses).

IP Address: ___________________________________________________________
Subnet Mask: _________________________________________________________
Default Gateway: _______________________________________________________

You can enter the Hostname of the system. If you do not have a DHCP server that automatically sets a DNS server, you can enter the IP addresses to configure DNS Servers. You can also define the domain names to search when resolving hostnames. DNS translates names of network nodes into addresses; specify this preference to use DNS to resolve the hostnames of devices to IP addresses.

Hostname: ___________________________________________________________
DNS Servers: _________________________________________________________
Name Search Domains: _________________________________________________

If you choose an option other than Auto (the default) for the Network Speed preference, ensure that the option matches the speed and duplex configured on your network switch.

Network Speed: ________________________ Network Duplex: _________________

You can enter the hostname or IP address of a Network Time Protocol (NTP) server to set the system date and time automatically. The LifeSize system ignores the value you specify for the NTP Server Hostname if the DHCP preference is set to Enabled and the DHCP server can pass an NTP server address to the LifeSize system.

Network Time Protocol (NTP): ____________________________________________

Audio Preferences: Active Microphone

The default for Active Microphone is Auto. The system detects attached audio input devices and selects one of them to be the active microphone in the following order:

- phone
- microphone in
- camera 1

If you wish to use a device connected to line in 1 or line in 2 on the codec as the active microphone, you must choose the corresponding line in option manually for Active Microphone.
The Active Microphone field in the System Information page shows which device is functioning as the active microphone. When the value is None, the No Active Microphone indicator appears in the status bar on the main screen of the user interface indicating that no active microphone is available. You can view the System Information page after you install the system and complete the initial configuration. From the main screen, press the button on the LifeSize remote control.

Note: If you choose Line In 1, Line In 1 (No AEC), Line In 2 or Line In 2 (No AEC) as the active microphone, and a device is not connected to the appropriate connector on the codec, the System Information page shows Line In 1 or Line In 2 as the status for Active Microphone. The No Active Microphone indicator does not appear in the user interface.

The Microphone In (No AEC), Line In 1 (No AEC), and Line In 2 (No AEC) options for the Active Microphone preference are for use with a microphone that has its own acoustic echo canceller (AEC).

Audio Preferences: Active Microphone Volume

You can adjust the audio level for the active microphone by selecting Active Microphone Volume and pressing OK on the LifeSize remote control.

Note: A built-in acoustic echo canceller and noise reducer are active when Microphone In, Camera 1, or Line In is the active microphone. The built-in acoustic echo canceller automatically attempts to adjust audio volume for optimum levels.
An audio meter appears below **Active Microphone Volume** when you access the preference. The audio meter follows the digital signal processing, Automatic Gain Control (AGC), and volume and tone controls on the transmitted voice path as depicted in the following illustration.

The dotted line illustrates the audio path when *Microphone In (No AEC), Line In 1 (No AEC), or Line In 2 (No AEC)* is selected as the active microphone. This mode is useful for setting up system gains but should never be used during calls unless the installation includes audio inputs with external AEC. Echo may occur if no AEC is employed.

If you choose LifeSize Phone as the active microphone, the **Active Microphone Volume** preference is not available. The LifeSize Phone microphones adjust volume automatically. The voice stream bypasses all processing in the LifeSize system, including the volume and tone controls, and is fed directly into the transmitted voice path.

The audio meter displays the level of the transmitted voice in decibels (dB) root mean square (RMS) below digital full scale (DFS). The meter is accurate to ± 1 dB. The maximum level is 0 dB. Levels below –50 dB are not displayed, and indicate a very quiet or inactive input. Typical levels during a call peak around –28 to –22 dB DFS. The AEC and AGC attempt to keep the RMS transmit level below –20 dB DFS. The following images show what appears in an audio meter at various levels.
LifeSize MicPod or LifeSize Focus, place someone where a participant in a call would normally sit in the conference room and ask the person to speak at a normal volume facing the active microphone. Use the audio meter to visually verify that the transmit level peaks in the desired -28 to -22 dB range.

LifeSize recommends a volume setting of 5 to 8 for **Active Microphone Volume** for most LifeSize MicPod applications.
LifeSize recommends a volume setting of 5 to 10 for Active Microphone Volume for most LifeSize Focus applications.

If you set **Active Microphone Volume** to a line in option when using an external mixer or amplified microphone, follow these steps:

1. Select either *Line in 1 (no AEC)* or *Line in 2 (no AEC)* for **Active Microphone** depending on the line in connector on the codec to which the device is attached.

2. Position someone approximately one meter from the microphone, facing it, speaking at a normal volume.

3. Adjust the **Active Microphone Volume** and the external mixer output level until the meter peaks in the -28 to -22 dB range. LifeSize recommends you adjust the external mixer volume so that you achieve peak levels in the -28 to -22 dB range of the audio meter with the **Active Microphone Volume** control no less than 5 or greater than 15.

4. If the microphone or mixer you use employs an echo canceller, no further adjustments are necessary. Otherwise, select *Line In 1* or *Line In 2* for **Active Microphone**. This turns on the LifeSize system’s echo canceller, noise reduction, and automatic gain control functions. If you do not use an echo canceller, you may experience severe echo effects.

5. After the adjustment, check that the peak levels when speaking normally one meter from the microphone are in the -28 to -22 dB range. The AGC attempts to keep the transmit level below -20 dB, which is the green range of the bar graph.

An audio meter is also available for the **Line In 1 Volume** and **Line In 2 Volume** preferences for setting an audio level for a device connected to these inputs on the codec when the line in 1 or line in 2 is not selected as the active microphone.

**Audio Preferences: Video and Voice Call Output**

If you plan to use external speakers other than LifeSize Phone for audio in both video and voice calls, ensure that the **Video Call Audio Output** and **Voice Call Audio Output** preferences are set to *Line Out*. If you are using LifeSize Phone for audio, set these preferences to *Phone*. By default, **Video Call Audio Output** is set to *Line Out*; **Voice Call Audio Output** is set to *Phone*. 
Audio Preferences: Testing Speakers

You can also test the primary output speakers for the appropriate audio level or to ensure they are working properly. Select Auto for Primary Audio Output Test to cycle through a test on your available speakers. The test continues until you select Off. You can also send the tone to either the left or right channel by choosing Test Left or Test Right. The tone is sent simultaneously to both line out and the HD video out of display 1.

LifeSize Room 220 Components

Your LifeSize Room 220 package contains the following components:

- One of the following audio components:
  - LifeSize Phone
  - LifeSize MicPod—(see “Optional Peripherals” on page 20 for the dual LifeSize MicPod option)
- LifeSize Camera 200 with standard 3 meter (9.8 foot) HDMI cable
- LifeSize Room 220 Codec
- LifeSize Remote Control (including three AAA batteries)
- Quick reference card
- Documentation CD
Installing a LifeSize Room 220 System

**Warning:** Exercise care when connecting cables to the codec to avoid damaging cables or the connectors on the codec. Face the back of the codec or ensure that all connectors are visible when connecting a cable to the codec.

To install the components of your LifeSize system, remove all components from the product packaging, including cables, and place them in the desired positions in your conference room.

**Warning:** Do not place anything on top of or adjacent to the codec that can obstruct air flow around the unit or generate heat. Doing so can cause the system to overheat and reboot. Prolonged overheating can result in damage to the codec. Ensure the room that houses the codec is properly ventilated and temperature controlled.

Refer to the quick reference card included with your system for a visual depiction of the proper setup. The numbers that appear on the quick reference card correspond to the following steps:

1. Open the battery compartment on the back side of the remote control.
   a. Before inserting the batteries, stretch each of the two straps across the outer battery slot closest to it.
   b. Insert the two outer batteries, negative end (-) first against the spring, then press the positive (+) end into place, trapping the cloth straps beneath the batteries.
   c. Lay the longer cloth strap over both batteries and insert the center battery’s negative end against the spring first to trap the longer cloth strap beneath it. Then press the positive end of the battery into place.
   d. Lay the ends of the cloth straps over the center battery and install the cover.
2. Insert the codec into its stand by aligning the pin holes at the base. Secure the codec in the stand by tightening the bolt on the bottom of the codec stand. **Optional:** Insert the rubber feet on the bottom of the codec stand. The codec is also designed to lay flat should you choose not to install the stand.

**Warning:** Use only the stand and bolt included in the product box with the codec. Using a stand and bolt from another LifeSize model can damage the codec.

**Note:** When using the stand, LifeSize recommends you route at least the thicker cables (DVI and HDMI) through the plastic strain relief guide on the stand to enhance the stability of the codec and prevent tipping. You can also remove the stand and lay the codec flat to improve stability.

3. To connect a LifeSize Camera 200 to the codec, insert the HDMI cable into the HD port on the rear side of the camera and plug the opposite end into the port marked with the HD in 1 symbol $\text{HD } \varepsilon_1$ on the back of the codec. Insert the power adapter cable into the power port on the rear side of the camera and plug the power adapter into a power outlet.

**Note:** LifeSize Camera 200 is supported only when connected to HD in on the codec. If you purchased a second LifeSize Camera 200 for use with LifeSize Room 220, insert the HDMI cable for the second camera into the port on the rear side of the camera and plug the opposite end into the port marked with the HD in 2 symbol $\text{HD } \varepsilon_2$ on the back of the codec. Insert the power adapter cable into the power port on the rear side of the camera and plug the power adapter into a power outlet. For more information about using two cameras with your LifeSize Room 220 system, refer to your LifeSize Video Communications Systems User Guide.

4. Insert the HDMI display cable into the port on the rear of your display and the opposite end into the port marked with the display 1 symbol $\text{HD } \epsilon_1$ on the back of the codec. (If you are using the codec in the upright position with the stand, LifeSize recommends you route this cable through the strain relief guide on the stand.) Insert the display power cord into a power outlet.

To connect a second display, insert the video display cable into the port on the rear of your display and the opposite end into the port marked with the display 2 symbol $\text{HD } \epsilon_2$ on the back of the codec. (If you are using the codec in the upright position with the stand, LifeSize recommends you route this cable through the strain relief guide on the stand.) Attach the display power cord to a power outlet. By default, the second display is blank and displays a message directing you to configure preferences for the display. After you complete the initial configuration, refer to “Configuring a Second Display” on page 19 to complete this process.
5. Insert the network cable into the network port marked with the LAN symbol on the back of the codec. Insert the opposite end of the network cable into a network port on the wall.

6. Do one of the following:

   a. If you are using the LifeSize Phone for audio, insert the phone cable into the port marked with the LAN symbol on the underside of the phone.

      **Note:** The exterior port marked with the symbol on the LifeSize Phone is reserved for future use.

      Insert the opposite end of the phone cable into the port marked with the LifeSize Phone symbol on the back of the codec. Ensure the cables are secured into the guides to avoid damage to them.

      **Note:** When the LifeSize Phone is connected to a LifeSize video communications system, you are unable to configure it as a standalone speakerphone. Configure your system using the LifeSize video communications system interface.

   b. If you are using a single LifeSize MicPod for audio, insert the end of the cable from the LifeSize MicPod into the microphone port marked with the microphone symbol on the back of the codec. If you are using the codec in the upright position with the stand, LifeSize recommends you route this cable through the strain relief guide on the stand. If the LifeSize MicPod is installed in an area where the cord could be pulled or tripped upon, refer to “Attaching the LifeSize MicPod Strain Relief Clip” on page 22.

      **Warning:** Tripping on the LifeSize MicPod cord can cause personal injury as well as permanent damage to the LifeSize MicPod cord connector and the connector in the codec. LifeSize recommends that you use the cable strain relief clip included in the LifeSize MicPod product box as described in “Attaching the LifeSize MicPod Strain Relief Clip” on page 22.

      If you are using dual LifeSize MicPods for audio, refer to “Configuring Dual LifeSize MicPods” on page 21 for a description of supported configuration options.
7. Insert the cord from the power adapter into the power outlet marked **DC 19V** on the back of the codec (near the base). Insert one end of the power cord into the power adapter and the opposite end into a power outlet on the wall.

The LifeSize system starts and illuminates a blue LED on the front of the codec. See “Status Icons” on page 26 for more information about the state of the system as it boots or as conditions change.

The camera initializes the first time it is connected to a codec; this process takes approximately 90 seconds.

**Warning:** Do not disturb or disconnect the devices during this time as you may damage the system.

8. An **Initial Configuration** screen appears and prompts you to configure the system. Refer to “Initial Configuration” on page 6 and the information you collected there previously to guide you through your configuration choices. Use the arrow keys on the remote control to navigate the preferences that appear in the initial configuration screens. Icons that appear at the bottom of each screen correspond to keys on the remote control and indicate what operations are available for the screen or a selected object.

If the initial configuration screen does not appear and the display is blank, refer to “Troubleshooting Installation Issues” on page 23.

The bottom of the screen contains the system status bar and the navigation bar. The system status bar indicates system and network status. When the system is booting, status also appears at the top of the **REDIAL** list to indicate the current state of the system. See “Status Icons” on page 26 for an explanation of status icons you may encounter.

**Connecting a PSTN Phone Line**

If you chose the **Touch Tone** option for the **Voice Dialing** preference during the initial configuration, ensure that you connect an RJ-11 PSTN phone cord to the PSTN phone port labeled ☑️ on the LifeSize codec and the other end to a phone jack on the wall.

**Locking the LifeSize Codec**

You can lock the LifeSize codec with a secure loop to prevent physical removal of the device. For assistance, contact your LifeSize Partner or LifeSize Customer Support.
Changing Display Resolution

The primary output on LifeSize Room 220 defaults to 720p60 and will work with any 720p HDMI display.

To change display resolution, navigate to Administrator Preferences : Appearance : Displays and choose Display 1 Resolution. You can change the resolution to 1920x1080i60 or 1920x1080p30 and it will work with most 1080 HDMI displays. However, some 1080p displays will not work with 1080p30 mode and the display may be blank. In this case you must configure the display resolution from either the LifeSize Phone (refer to “Configuring Display Output from LifeSize Phone” on page 24) or from the web administration interface for the LifeSize system (refer to the LifeSize Video Communications Systems Administrator Guide). LifeSize recommends that before you change the display resolution to 1920x1080p30, ensure that you can access the Display 1 Resolution preference using one of these methods.

Note: To access the web administration interface for the system, HTTP access must be set to Enabled (the default) in Administrator Preferences : Security : General and you must identify the IP address of the LifeSize system. The IP address appears in the upper right corner on the main page of the user interface.
Configuring a Second Display

If you installed a second display, you must configure it. Navigate to Administrator Preferences : Appearance : Layout and choose Display 2 Layout, which, by default is set to None.

- Choose Presentations + DVI-I Input to display presentations (local and remote) during a call that is sending or receiving a presentation. When not in a call, DVI-I input appears in the display.

- Choose Calls + Presentations + DVI-I Input to display:
  - video images from video calls
  - presentations (local and remote) in a call that is sending or receiving a presentation
  - DVI-I input when not in a call

- Choose Simulcast Calls + DVI-I Input to show the same output on Display 2 as shown on Display 1 during calls.

If you use a VGA projector as Display 2, navigate to Administrator Preferences : Appearance : Displays and choose Display 2 Resolution. Configure its resolution to 1280 x 768 to match the default HD configuration of Display 1.

**Note:** To use the Calls + Presentations + DVI-I Input or Simulcast Calls + DVI-I Input options, you must set Display 1 and Display 2 to the same resolution. Otherwise, you will see a warning message and this option with be forced to Presentations + DVI-I Input.
Optional Peripherals

You can connect the following optional peripherals to enhance your LifeSize system:

<table>
<thead>
<tr>
<th>Peripheral</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial RS-232</td>
<td>For use with supported third-party cameras using VISCA control or for automation control with Crestron or AMX controllers.</td>
</tr>
<tr>
<td>HD in 2</td>
<td>For use with a second LifeSize Camera 200.</td>
</tr>
<tr>
<td>HD Camera</td>
<td>For use with a LifeSize Camera or LifeSize Focus.</td>
</tr>
<tr>
<td>Microphone in</td>
<td>For use with a single or dual LifeSize MicPod configuration</td>
</tr>
<tr>
<td></td>
<td>In a single LifeSize MicPod configuration, you can add a LifeSize MicPod extension cable (15 meters, 49.2 feet) to the LifeSize MicPod.</td>
</tr>
<tr>
<td></td>
<td>In a dual LifeSize MicPod configuration, you use a combination of two LifeSize MicPods, one splitter cable, and extension cables in large rooms to create wider coverage of audio input. Refer to “Configuring Dual LifeSize MicPods” on page 21 for supported configurations.</td>
</tr>
<tr>
<td>DVI-I In (PC in)</td>
<td>For use with devices and laptops for presentations or to share PC data. Accepts both digital video and VGA analog signals with the proper adapter cable. For devices and PCs with VGA output, LifeSize includes a DVI-A to VGA cable. An HDMI source can be used with an adapter. For more information about supported resolutions and audio support, refer to the LifeSize Video Communications Systems Administrator Guide.</td>
</tr>
<tr>
<td>Audio In (Line In) 1</td>
<td>For use with an external line level audio input, in addition to the LifeSize Phone or LifeSize MicPod.</td>
</tr>
<tr>
<td>Audio In (Line In) 2</td>
<td>For use with an external line level audio input, in addition to the LifeSize Phone or LifeSize MicPod.</td>
</tr>
<tr>
<td>Networker</td>
<td>For use with LifeSize Networker.</td>
</tr>
<tr>
<td>Analog phone line in</td>
<td>For PSTN connectivity.</td>
</tr>
<tr>
<td>Auxiliary Video In</td>
<td>For inputting component, S-video or composite video. Only one can be used at a time. A component source always takes precedence. If S-video and composite sources are both plugged in, the S-video source takes precedence. a</td>
</tr>
<tr>
<td>USB port</td>
<td>Reserved for future use.</td>
</tr>
</tbody>
</table>

a. Auxiliary Video In is typically used to connect a DVD or VCR to share standard video content with the far end during a presentation or to view the content locally.
Configuring Dual LifeSize MicPods

If you are using dual LifeSize MicPods, you can use the splitter cable to connect a combination of extension cables and two LifeSize MicPods to the single LifeSize MicPod port on your LifeSize codec for maximum omnidirectional audio coverage in large conference rooms.

Dual LifeSize MicPod configurations are limited to two LifeSize MicPods and one splitter cable. (You cannot use multiple splitters to connect to more than two LifeSize MicPods.) However, you can use variations on three configurations of extension cables:

- If you connect the male end of the splitter directly to the codec, you can use none, or one extension cable to connect a LifeSize MicPod to each of the female ends of the splitter.
- If you use one extension cable to connect the codec to the splitter, you can use none, or one extension cable to connect a LifeSize MicPod to each of the female ends of the splitter.
- If you use two extension cables to connect the codec to the splitter, you must connect both LifeSize MicPods directly to the female ends of the splitter.

If the LifeSize MicPods are installed in an area where the cord could be pulled or tripped upon, refer to “Attaching the LifeSize MicPod Strain Relief Clip” on page 22.

**Warning:** Tripping on the cord can cause personal injury as well as permanent damage to the LifeSize MicPod cord connector and the connector in the codec. LifeSize recommends that you use the cable strain relief clip included in the LifeSize MicPod product box as described in “Attaching the LifeSize MicPod Strain Relief Clip” on page 22.

A LifeSize codec detects any splitter or cable attached to the microphone input of the codec as a LifeSize MicPod. If a LifeSize MicPod is not attached to the extension or splitter cable and the microphone input is selected as the active microphone, no audio is available. The No Active Microphone indicator does not appear in the status bar and the **Active Microphone** field in the **System Information** page reports **Microphone In** as the active microphone.
Attaching the LifeSize MicPod Strain Relief Clip

If the LifeSize MicPod is installed in an area where the cord could be pulled or tripped upon, LifeSize recommends using the strain relief clip included with your LifeSize MicPod to reduce the chance of disconnecting or damaging the plug or the LifeSize video communications system codec.

Before attaching the strain relief clip to the codec, ensure that the codec surface is clean (free of dirt, dust, oil, and other residues) and dry. The adhesive tape on the strain relief clip is intended for a single use. Attach the strain relief clip to the codec and route the LifeSize MicPod cable through the strain relief clip as shown in the following diagram.

To obtain a replacement strain relief clip, contact your LifeSize Partner.
Verifying Your Installation

The *LifeSize Video Systems Administrator Guide* explains how to place a test call to verify your installation. It also explains additional adjustments you may need to make to your LifeSize configuration and your network if you use:

- Network Address Translation (NAT)
- a firewall
- H.323 gatekeepers
- Session Initiation Protocol (SIP)
- other network security systems

Troubleshooting Installation Issues

Installation issues that you may encounter with your LifeSize system typically involve improperly connected cables, or network bandwidth or connectivity. For information about troubleshooting other issues that users may encounter with LifeSize systems refer to the *LifeSize Video Communications Systems User Guide*.

Improperly connected or loose cables are common causes of problems with hardware units. When investigating a system problem, first inspect all the external controls and cable connections. Ensure that connections are correct and secure, and that nothing is obstructing the cables.
Configuring Display Output from LifeSize Phone

If you are using LifeSize Phone and your display shows the initial configuration screen but the image is distorted and unusable or the display is blank, you can configure the display from the LifeSize Phone user interface. Follow these steps:

1. Ensure that no calls are in progress.
2. Log in to the Admin Menu on your LifeSize Phone.
   a. Press sequentially when the phone is idle.
   b. Enter the administrator password (1 2 3 4 by default) and press .
3. Press 1 on the keypad to select Preferences.
4. Press 1 on the keypad to select Display 1.
5. Press the key to select Auto.
6. Press the key to accept your change(s).
   
   **Note:** If you remain idle on any preference screen for two minutes, you return to the main screen.
7. When you have finished setting preferences, press the key to save them.
8. Press to return to the previous screen.

**No Power**

To troubleshoot a power problem, complete the following steps:

1. Disconnect the power supply unit (PSU) from the LifeSize codec and the AC source.
2. Plug an appliance you know works into the AC source to determine if the source works.
3. If the AC source works, plug the PSU into the AC source, but do not connect the PSU to the LifeSize codec. If the green LED on the PSU illuminates, the PSU is probably good.
4. Disconnect the PSU from the AC source. Connect the PSU to the LifeSize codec. Reconnect the PSU to the AC source. If the LifeSize codec fails to boot and the green LED on the PSU dims, the codec may be the source of the problem.
IP Address Displays Invalid Value

After you complete the initial configuration, if the IP address that appears at the top of the main screen displays an invalid value, one of the following conditions may exist:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>The unit is configured to obtain an address using DHCP and no DHCP server is available.</td>
<td>Verify that the unit is plugged into a network that has a DHCP server present.</td>
</tr>
<tr>
<td><strong>Note:</strong> The DHCP client self-assigns an address in the 169.254 class B network and the red network symbol appears in the status bar on the main screen.</td>
<td></td>
</tr>
<tr>
<td>Faulty Ethernet cable connection.</td>
<td>Replace the Ethernet cable with a high quality cable.</td>
</tr>
<tr>
<td>The unit is configured to use a static IP address, but no IP address has been entered.</td>
<td>Identify and enter the necessary IP information if you disable DHCP.</td>
</tr>
<tr>
<td>Network connection is unavailable.</td>
<td>Inspect your network connection.</td>
</tr>
<tr>
<td>A red network symbol appears in the status bar on the main screen.</td>
<td></td>
</tr>
</tbody>
</table>

Camera Issues

Video from the camera appears in a small window on the main screen of the user interface above the Redial list. If no video from the camera appears, do the following:

- Ensure that the camera is properly connected to the LifeSize codec as described in “Installing a LifeSize Room 220 System” on page 14.
- Verify that the blue LED on the front of the camera is lit and not blinking, indicating that power is active.
- From the main screen of the user interface, press to access the System Menu. Press to access page 2 of the System Information page. Ensure that the status of the camera is Ready.
- Ensure that the primary input is set to the high definition camera. Press on the remote control. If Primary Input : HD Camera does not appear at the top of the screen, press to display the Primary Input selection dialog. Use the arrow keys on the remote control to select the appropriate high definition camera and press OK.

Improving a Dim Image

If the image is too dim, you can adjust the HD Camera Brightness preference in User (or Administrator) Preferences : Diagnostics : High Definition Camera.
Attached Video Input Device Not Working

When you connect a video input device that has capabilities not supported by a LifeSize system, the status **Out of range** appears on the **System Information** page for that input. The device may be in a mode that the codec does not support. Changing the mode may help. Otherwise, the device is not supported.

## Status Icons

The following table identifies the icons that can appear in the system status bar.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon]</td>
<td>Indicates that the communication subsystem is initializing. If this icon reappears after the system has booted, a problem has occurred. Reboot the system.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Indicates that the system is initializing. When the system is initializing, functionality on the main screen is disabled and no entries appear in the REDIAL list. This icon also appears when a new device is connected to the system after the system boots and disappears when the device is ready. If the icon persists, a problem has occurred and rebooting the system is necessary.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Indicates that the connected phone has been detected and the phone is initializing. If the icon persists, a problem has occurred and rebooting the system is necessary.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Indicates that the system does not have an active microphone. Check the device’s connections and then check the option you selected for the <strong>Active Microphone</strong> preference.</td>
</tr>
</tbody>
</table>

**Network Status**

Identifies the network status, as follows:

- **connected** (green indicator)
- **in progress** (yellow indicator)
- **disconnected** (red indicator)
<table>
<thead>
<tr>
<th>Icon</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Overheating</td>
<td>This yellow indicator warns you when the system temperature is above normal operating temperature. The codec adjusts fan speed automatically to cool itself. This red indicator warns that the system is overheated and approaching the maximum allowed operating temperature and will automatically reboot after reaching it.</td>
</tr>
<tr>
<td></td>
<td>Warning: Temperatures that require the codec to reboot can permanently damage codec components. Ensure the room that houses the codec is properly ventilated and temperature controlled.</td>
</tr>
</tbody>
</table>
