

ShopTalk:

Independent Blind Shopping = Verbal Route Directions + Bar Code Scans

John Nicholson and Vladimir Kulyukin
Computer Science Assistive Technology Laboratory
Department of Computer Science
Utah State University

Grocery Shopping for the Visually Impaired

- Grocery shopping is a difficult task
 - Average supermarket has 45,000 products
- Current options
 - At Store
 - Another person must be available
 - Websites
 - Not all websites service local area
 - Delivery is not immediate

ShopTalk

- Verbal instructions guide user
- User Input
 - Numeric keypad
 - Bar code scanner
- Off-the-shelf (OTS) components
- Does not require change to store environment

Macro-Navigation

- Topological Map
 - Store entrance
 - Entrances to aisles
 - Cashier lane
- ShopTalk provides verbal directions at user's request
- User uses own navigation skills
- Scanning a bar code provides error correction

Product Search

- Database of products
- In general area of product, search for exact position of product on shelves
- Shopper uses bar code scanner
- System provides verbal instructions on where to scan next
- Whenever a bar code is scanned, system knows where user is

Modified Bar Code Scanner

Describing Product Location

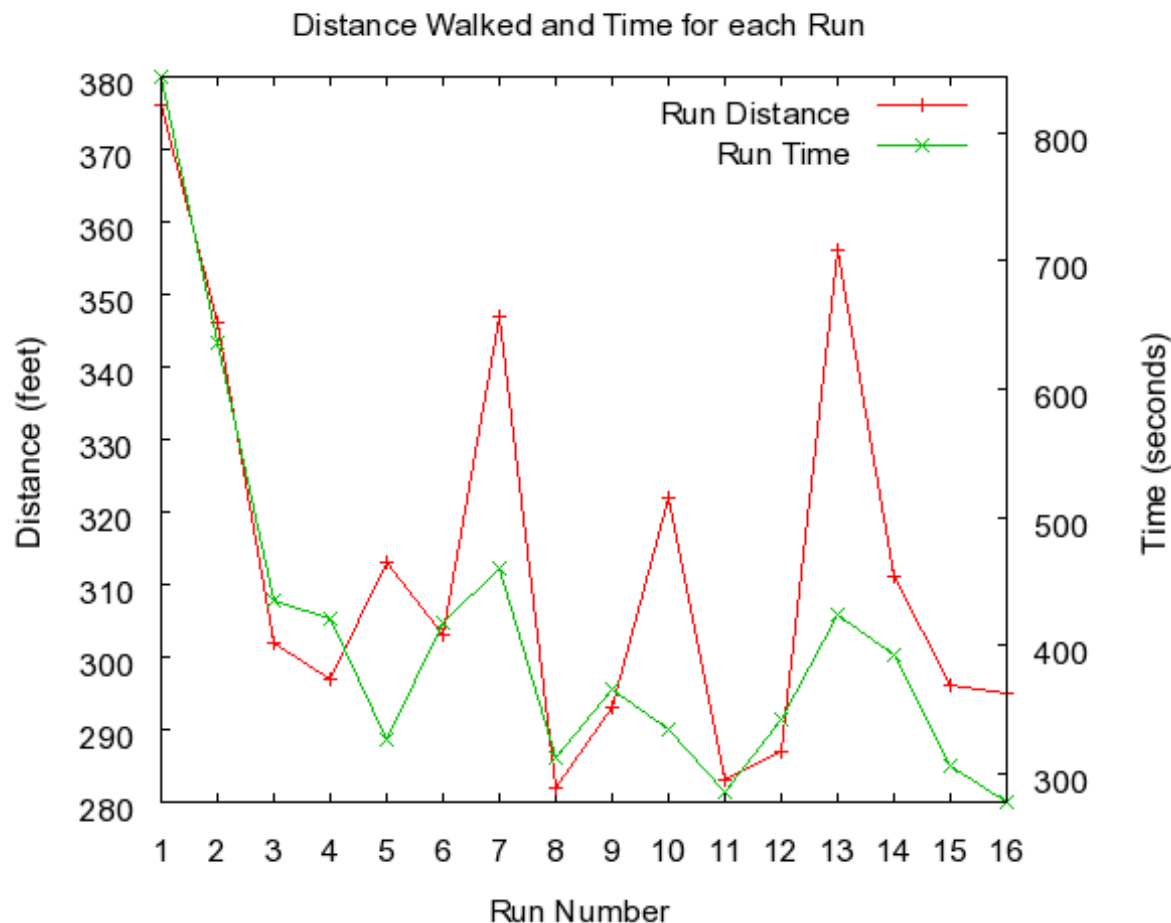

- Aisle
- Side of aisle
- Shelf section
- Shelf
- Product position

Single Participant Pilot Study

- 1,655 shelf bar codes in one aisle of Lee's Supermarket scanned
- 7 product sets
 - 3 products per product set
- 16 runs completed
 - At least one run for each product set

Results

- All runs completed
- All products successfully found.
- Distance visually impaired participant compared favorably with sighted person walking same route.
- Average of 4.2 barcode scans to find individual product.

Future Work

- In grocery
 - Already scanned two more aisles
 - Test system with more users over more complex routes
- Test outdoor navigation using only verbal instruction
