Estimating and Simulating a SIRD Model of COVID-19 for Many Countries, States, and Cities

Jesús Fernández-Villaverde and Chad Jones

Extended results for West Virginia
Based on data through August 24, 2020
Outline of Slides

- Basic data from Johns Hopkins CSSE (raw and smoothed)
- Brief summary of the model
- Baseline results ($\delta = 1.0\%, \gamma = 0.2, \theta = 0.1$)
- Simulation of re-opening – possibilities for raising $R_0$
- Results with alternative parameter values:
  - Lower mortality rate, $\delta = 0.8\%$
  - Higher mortality rate, $\delta = 1.2\%$
  - Infections last longer, $\gamma = 0.15$
  - Cases resolve more quickly, $\theta = 0.2$
  - Cases resolve more slowly, $\theta = 0.07$
- Data underlying estimates of $R_0(t)$
Underlying data from Johns Hopkins CSSE

- Raw data
- Smoothed = 7 day centered moving average
- No “excess deaths” correction (change as of Aug 6 run)
West Virginia: Daily Deaths per Million People
West Virginia: Daily Deaths per Million People (Smoothed)

West Virginia

Daily deaths per million people (smoothed)
Brief Summary of Model

- See the paper for a full exposition
- A 5-state SIRDC model with a time-varying $R_0$

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Baseline</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\delta$</td>
<td>1.0%</td>
<td>Mortality rate from infections (IFR)</td>
</tr>

</tbody>
</table>
Estimates of Time-Varying $R_0$

– Inferred from daily deaths, and
– the change in daily deaths, and
– the change in (the change in daily deaths)
(see end of slide deck for this data)
West Virginia: Estimates of $R_0(t)$

West Virginia

$\delta = 0.010 \quad \theta = 0.10 \quad \gamma = 0.20$
West Virginia: Percent Currently Infectious

West Virginia
Peak I/N = 0.14%  Final I/N = 0.09%  δ = 0.010  θ = 0.10  γ = 0.20
West Virginia: Growth Rate of Daily Deaths over Past Week (percent)

West Virginia
\[ \delta = 0.010 \quad \theta = 0.10 \quad \gamma = 0.20 \]
Notes on Interpreting Results
Guide to Graphs

• **Warning:** Results are often very uncertain; this can be seen by comparing across multiple graphs. See the original paper.

• **7 days of forecasts: Rainbow color order!**
  ROY-G-BIV (old to new, low to high)
  - Black = current
  - **Red** = oldest, **Orange** = second oldest, **Yellow** = third oldest...
  - **Violet (purple)** = one day earlier

• For robustness graphs, same idea
  - Black = baseline (e.g. $\delta = 1.0\%$)
  - **Red** = lowest parameter value (e.g. $\delta = 0.8\%$)
  - **Green** = highest parameter value (e.g. $\delta = 1.2\%$)
How does $R_0$ change over time?

- Inferred from death data when we have it
- For future, two approaches:
  - Alternatively, we fit this equation:
    \[
    \log R_0(t) = a_0 - \alpha(Daily\ Deaths)
    \]
    \[
    \Rightarrow \alpha \approx 0.05
    \]
    $R_0$ declines by 5 percent for each new daily death, or rises by 5 percent when daily deaths decline

- Robustness: Assume $R_0(t) = final$ empirical value. Constant in future, so no $\alpha$ adjustment $\rightarrow \alpha = 0$
Repeated “Forecasts” from the past 7 days of data

– After peak, forecasts settle down.
– Before that, very noisy!
– If the region has not peaked, do not trust
– With $\alpha = .05$ (see robustness section for $\alpha = 0$)
West Virginia (7 days): Daily Deaths per Million People ($\alpha = .05$)

West Virginia

$R_0=1.6/0.8/0.9$  $\delta = 0.010$  $\alpha=0.05$  $\beta=0.1$  $\%Infect= 2/2/2$

DATA THROUGH 24-AUG-2020
West Virginia (7 days): Cumulative Deaths per Million (Future, $\alpha = .05$)

West Virginia

$R_0 = 1.6/0.8/0.9 \quad \delta = 0.010 \quad \alpha = 0.05 \quad \theta = 0.1 \quad \%\text{Infect} = 2/2/2$

DATA THROUGH 24-AUG-2020
West Virginia (7 days): Cumulative Deaths per Million, Log Scale ($\alpha = 0.05$)

West Virginia
$R_0 = 1.6/0.8/0.9$  $\delta = 0.010$  $\alpha = 0.05$  $\theta = 0.1$  $\% Infect = 2/2/2$

New York City

Italy
Robustness to Mortality Rate, $\delta$
West Virginia: Cumulative Deaths per Million ($\delta = .01/.008/.012$)

West Virginia

$R_0 = 1.6/0.8/0.9 \quad \delta = 0.010 \quad \alpha = 0.05 \quad \theta = 0.1 \quad \%\text{Infect} = 2/2/2$

DATA THROUGH 24-AUG-2020
West Virginia: Daily Deaths per Million People ($\delta = .01/.008/.012$)

West Virginia

$R_0=1.6/0.8/0.9$  $\delta = 0.010$  $\alpha=0.05$  $\theta=0.1$  $\%\text{Infect}= 2/2/2$

DATA THROUGH 24-AUG-2020

Daily deaths per million people
West Virginia: Cumulative Deaths per Million ($\delta = .01/.008/.012$)

West Virginia

$R_0 = 1.6/0.8/0.9$  $\delta = 0.010$  $\alpha = 0.05$  $\theta = 0.1$  $%Infect = 2/2/2$

DATA THROUGH 24-AUG-2020
Reopening and Herd Immunity

– Black: assumes $R_0(today)$ remains in place forever
– Red: assumes $R_0(suppress) = 1/s(today)$
– Green: we move 25% of the way from $R_0(today)$ back to initial $R_0 = “normal”$
– Purple: we move 50% of the way from $R_0(today)$ back to initial $R_0 = “normal”$

NOTE: Lines often cover each other up
West Virginia: Re-Opening ($\alpha = .05$)

West Virginia

$R_0(t)=0.8, \ R_0(\text{suppress})=1.0, \ R_0(25/50)=1.1/1.4, \ \delta = 0.010, \ \alpha=0.05$
West Virginia: Re-Opening ($\alpha = 0$)

West Virginia

$R_0(t)=0.8, \ R_0(\text{suppress})=1.0, \ R_0(25/50)=1.1/1.4, \ \delta = 0.010, \ \alpha=0.00$
Results for alternative parameter values
West Virginia (7 days): Daily Deaths per Million People ($\alpha = 0$)

West Virginia

$R_0 = 1.6/0.8/0.8 \quad \delta = 0.010 \quad \alpha = 0.00 \quad \theta = 0.1 \quad \%Infect = 2/2/2$

DATA THROUGH 24-AUG-2020
West Virginia (7 days): Cumulative Deaths per Million (Future, $\alpha = 0$)

West Virginia

$R_0 = 1.6/0.8/0.8 \quad \delta = 0.010 \quad \alpha = 0.00 \quad \theta = 0.1 \quad \%\text{Infect} = 2/2/2$
