

Taxing Top Incomes in a World of Ideas

Chad Jones

September 2019

The Saez (2001) Calculation

- Income: $z \sim \text{Pareto}(\alpha)$
- Tax revenue:

$$T = \tau_0 \bar{z} + \tau(z_m - \bar{z})$$

where z_m is average income above cutoff \bar{z}

- Revenue-maximizing top tax rate:

$$\underbrace{z_m - \bar{z}}_{\text{mechanical gain}} + \underbrace{\tau z'_m(\tau)}_{\text{behavioral loss}} = 0$$

- Divide by $z_m \Rightarrow$ elasticity form and rearrange:

$$\tau^* = \frac{1}{1 + \alpha \cdot \eta_{z_m, 1-\tau}}$$

where $\alpha = \frac{z_m}{z_m - \bar{z}}$.

$$\tau^* = \frac{1}{1 + \alpha \cdot \eta_{z_m, 1-\tau}}$$

- Intuition

- Decreasing in $\eta_{z_m, 1-\tau}$: elasticity of top income wrt $1 - \tau$
- Increasing in $\frac{1}{\alpha} = \frac{z_m - \bar{z}}{z_m}$: change in revenue as a percent of income = Pareto inequality

- Diamond and Saez (2011) Calibration

- $\alpha = 1.5$ from Pareto income distribution
- $\eta = 0.2$ from literature

$$\Rightarrow \tau_{d-s}^* \approx 77\%$$

Overview

- Saez (2001) and following literature
 - “Macro”-style calibration of optimal top income taxation
- How does this calculation change when:
 - New ideas drive economic growth
 - The reward for a new idea is a top income
 - Creation of ideas is broad
 - A formal “research subsidy” is imperfect (Walmart, Amazon)
 - A small number of entrepreneurs \Rightarrow the bulk of economy-wide growth
- $\uparrow \tau$ lowers consumption **throughout the economy** via nonrivalry

Literature

- **Human capital:** Badel and Huggett, Kindermann and Krueger
- **Superstars/inventors:** Scheuer and Werning, Chetty et al
- **Spillovers:** Lockwood-Nathanson-Weyl
- **Mirrlees w/ Imperfect Substitution:** Sachs-Tsyvinski-Werquin
- **Inventors and taxes:** Akcigit-Baslandze-Stantcheva, Moretti and Wilson, Akcigit-Grigsby-Nicholas-Stantcheva
- **Growth and taxes:** Stokey and Rebelo, Jaimovich and Rebelo

This paper does not calculate “the” optimal top tax rate

- Many other considerations:
 - Political economy of inequality
 - Occupational choice (other brackets, concavity)
 - Top tax diverts people away from finance to ideas?
 - Social safety net, lenient bankruptcy insure the downside
 - How sensitive are entrepreneurs to top tax rates?
 - Empirical evidence on growth and taxes
 - Rent seeking, human capital
- Still, including economic growth and ideas seems important

Basic Setup

Overview

- BGP of an idea-based growth model. Romer 1990, Jones 1995
 - Semi-endogenous growth
 - Basic R&D (subsidized directly), Applied R&D (top tax rate)
 - BGP simplifies: static comparison vs transition dynamics
- Three alternative approaches to the top tax rate:
 - Revenue maximization
 - Maximize welfare of “workers”
 - Maximize utilitarian social welfare

Environment for Full Growth Model

Final output	$Y_t = \int_0^{A_t} x_{it}^{1-\psi} di (\mathbb{E}(ez)M_t)^\psi$
Production of variety i	$x_{it} = \ell_{it}$
Resource constraint (ℓ)	$\int \ell_{it} di = L_t$
Resource constraint (N)	$L_t + S_{bt} = N_t$
Population growth	$N_t = \bar{N} \exp(nt)$
Entrepreneurs	$S_{at} = \bar{S}_a \exp(nt)$
Managers	$M_t = \bar{M} \exp(nt)$
Applied ideas	$\dot{A}_t = \bar{a}(\mathbb{E}(ez)S_{at})^\lambda A_t^{\phi_a} B_t^\alpha$
Basic ideas	$\dot{B}_t = \bar{b}S_{bt}^\lambda B_t^{\phi_b}$
Talent heterogeneity	$z_i \sim F(z)$
Utility (S_a, M)	$u(c, e) = \theta \log c - \zeta e^{1/\zeta}$

The Economic Environment

- Consumption goods produced by managers \tilde{M} , labor L , and **nonrival** “applied” ideas A :

$$Y = A^\gamma \tilde{M}^\psi L^{1-\psi} \quad (1)$$

- Applied ideas produced from entrepreneurs, effort e , talent z , and basic research ideas B :

$$\dot{A}_t = \bar{a}(\mathbb{E}(ez)S_{at})^\lambda A_t^{\phi_a} B_t^\alpha$$

- Fundamental ideas produced from basic research:

$$\dot{B}_t = \bar{b}S_{bt}^\lambda B_t^{\phi_b}$$

- \tilde{M} , L , S_a , S_b exogenous. e , z endogenous (unspecified for now)

Nonrivalry of Ideas (Romer): $Y = A^\gamma \tilde{M}^\psi L^{1-\psi}$

- Constant returns to rival inputs \tilde{M}, L
 - Given a stock of nonrival blueprints/ideas A
 - Standard replication argument
- \Rightarrow Increasing returns to ideas and rival inputs together
 - $\gamma > 0$ measures the degree of IRS
- Hints at why effects can be large
 - One computer or year of school \Rightarrow 1 worker more productive
 - One new idea \Rightarrow any number of people more productive

Distortions of the computer/schooling have small effects.

Distorting the creation of the idea...

BGP from a Dynamic Growth Model

- BGP implies that stocks are proportional to flows:
 - A and B are proportional to S_a and S_b (to some powers)
 - S_a, S_b, L all grow at the same exogenous population growth rate.
- Stock of applied ideas (being careless with exponents wlog)

$$A = \nu_a \mathbb{E}[ez] S_a B^\beta \quad (2)$$

- Stock of basic ideas

$$B = \nu_b S_b \quad (3)$$

Output = Consumption:

- Combining (1) - (3) with $\tilde{M} = \mathbb{E}[ez]M$:

$$Y = \left(\nu \mathbb{E}[ez] S_a S_b^\beta \right)^\gamma (\mathbb{E}[ez]M)^\psi L^{1-\psi}$$

- Output per person $y \propto (S_a S_b^\beta)^\gamma$
 - Intuition: y depends on **stock** of ideas, not ideas per person
 - LR growth = $\gamma(1 + \beta)n$ where n is population growth
- Taxes distort $\mathbb{E}(ez)$:
 - ψ effect is traditional, but ψ small?
 - γ effect via nonrivalry of ideas, can be large!

Nonlinear Income Tax Revenue

$$T = \underbrace{\tau_0[wL + wS_b + w_a\mathbb{E}(ez)S_a + w_m\mathbb{E}(ez)M]}_{\text{all income pays } \tau_0} \\ + \underbrace{(\tau - \tau_0)[(w_a\mathbb{E}(ez) - \bar{w})S_a + (w_m\mathbb{E}(ez) - \bar{w})M]}_{\text{income above } \bar{w} \text{ pays an additional } \tau - \tau_0}$$

- Full growth model: entrepreneurs paid a constant share of GDP

$$\frac{w_a\mathbb{E}(ez)S_a}{Y} = \rho_s \quad \text{and} \quad \frac{w_m\mathbb{E}(ez)M}{Y} = \rho_m.$$

and $Y = wL + w_bS_b + w_a\mathbb{E}(ez)S_a + w_m\mathbb{E}(ez)M$, $\rho \equiv \rho_s + \rho_m$

$$\Rightarrow T = \tau_0 Y + (\tau - \tau_0) [\rho Y - \bar{w}(S_a + M)]$$

Some Intuition

- Entrepreneurs/managers paid a constant share of GDP

$$\frac{w_a \mathbb{E}(ez) S_a}{Y} = \rho_s \quad \text{and} \quad \frac{w_m \mathbb{E}(ez) M}{Y} = \rho_m.$$

- Production: $Y = \left(\nu \mathbb{E}[ez] S_a S_b^\beta \right)^\gamma (\mathbb{E}[ez] M)^\psi L^{1-\psi}$
- Efficiency: Pay \sim Cobb-Douglas exponents. IRS means cannot!
- Jones and Williams (1998) social rate of return calculation:

$$\tilde{r} = g_Y + \lambda g_y \left(\frac{1}{\rho_s(1-\tau)} - \frac{1}{\gamma} \right)$$

\Rightarrow After tax share of payments to entrepreneurs should equal $\gamma \rho_s(1-\tau)$ versus γ is one way of viewing the tradeoff

The Top Tax Rate that Maximizes Revenue

Revenue-Maximizing Top Tax Rate

- Key policy problem:

$$\max_{\tau} T = \tau_0 Y + (\tau - \tau_0) [\rho Y - \bar{w}(S_a + M)]$$

s.t.

$$Y = \left(\nu \mathbb{E}[ez] S_a S_b^\beta \right)^\gamma (\mathbb{E}[ez] M)^\psi L^{1-\psi}$$

- A higher τ reduces the effort of entrepreneurs/managers
 - Leads to less innovation
 - which reduces **everyone's income** (Y)
 - which lowers tax revenue received via τ_0

Solution

$$\max_{\tau} T = \tau_0 Y(\tau) + (\tau - \tau_0) [\rho Y(\tau) - \bar{w} S_a]$$

- FOC:

$$\underbrace{(\rho - \bar{\rho}) Y}_{\text{mechanical gain}} + \underbrace{\frac{\partial Y}{\partial \tau} \cdot [(1 - \rho)\tau_0 + \rho\tau]}_{\text{behavioral loss}} = 0$$

where $\bar{\rho} \equiv \frac{\bar{w}(S_a + M)}{Y}$

- Rearranging with $\Delta\rho \equiv \rho - \bar{\rho}$

$$\tau_{rm}^* = \frac{1 - \tau_0 \cdot \frac{1 - \bar{\rho}}{\Delta\rho} \cdot \eta_{Y, 1 - \tau}}{1 + \frac{\rho}{\Delta\rho} \eta_{Y, 1 - \tau}}$$

Solution

$$\tau_{rm}^* = \frac{1 - \tau_0 \cdot \frac{1-\rho}{\Delta\rho} \cdot \eta_{Y,1-\tau}}{1 + \frac{\rho}{\Delta\rho} \eta_{Y,1-\tau}} \quad \text{vs} \quad \tau_{ds}^* = \frac{1}{1 + \alpha \cdot \eta_{z_m,1-\tau}}$$

- Remarks: Two key differences
 - $\eta_{Y,1-\tau}$ **versus** $\eta_{z_m,1-\tau}$
 - $\eta_{Y,1-\tau} \Rightarrow$ How GDP changes if researchers keep more
 - $\eta_{z_m,1-\tau} \Rightarrow$ How average top incomes change
 - If $\tau_0 > 0$, then τ^* is lower
 - Distorting research lowers GDP
 - \Rightarrow lowers revenue from other taxes!

Guide to Intuition

$\eta_{Y,1-\tau}$	The economic model
$\rho \eta_{Y,1-\tau}$	Behavioral effect via top earners
$(1 - \rho) \eta_{Y,1-\tau}$	Behavioral effect via workers
$\Delta\rho \equiv \rho - \bar{\rho}$	Tax base for τ , mechanical effect
$1 - \Delta\rho$	Tax base for τ_0

What is $\eta_{Y,1-\tau}$?

$$Y = \left(\nu \mathbb{E}[ez] S_a S_b^\beta \right)^\gamma (\mathbb{E}[ez] M)^\psi L^{1-\psi} \Rightarrow \eta_{Y,1-\tau} = (\gamma + \psi)\zeta$$

- γ = degree of IRS via ideas
- ψ = manager's share = 0.15 (not important)
- ζ is the elasticity of $\mathbb{E}[ez]$ with respect to $1 - \tau$.
 - Standard Diamond-Saez elasticity: $\zeta = \eta_{z_m,1-\tau}$
 - How individual behavior changes when the tax rate changes
 - Cool insight from PublicEcon: all that matters is the **value** of this elasticity, not the mechanism!
 - So for now, just treat as a parameter (endogenized later)

Calibration

- Parameter values for numerical examples

$$\gamma \in [1/8, 1]$$

$$g_{tfp} = \gamma(1 + \beta) \cdot g_S \approx 1\%.$$

$$\frac{\zeta}{1-\zeta} \in \{0.2, 0.5\}$$

Behavioral elasticity. Saez values

$$\tau_0 = 0.2$$

Average tax rate outside the top.

$$\Delta\rho = 0.10$$

Share of income taxed at the top rate; top returns account for 20% of taxable income.

$$\rho = 0.15$$

So $\frac{\rho}{\Delta\rho} = 1.5$ as in Saez pareto parameter, α .

Revenue-Maximizing Top Tax Rate, τ_{rm}^*

Case	Behavioral Elasticity	
	0.20	0.50
Diamond-Saez:	0.80	0.67
No ideas, $\gamma = 0$		
$\tau_0 = 0$:	0.96	0.93
$\tau_0 = 0.20$:	0.92	0.85
Degree of IRS, γ		
1/8	0.86	0.74
1/4	0.81	0.64
1/2	0.70	0.48
1	0.52	0.22

Revenue-Maximizing Top Tax Rate, τ_{rm}^*

Case	Behavioral Elasticity	
	0.20	0.50
Diamond-Saez:	0.80	0.67
No ideas, $\gamma = 0$		
$\tau_0 = 0$:	0.96	0.93
$\tau_0 = 0.20$:	0.92	0.85
Degree of IRS, γ		
1/8	0.86	0.74
1/4	0.81	0.64
1/2	0.70	0.48
1	0.52	0.22

Revenue-Maximizing Top Tax Rate, τ_{rm}^*

Case	Behavioral Elasticity	
	0.20	0.50
Diamond-Saez:	0.80	0.67
No ideas, $\gamma = 0$		
$\tau_0 = 0$:	0.96	0.93
$\tau_0 = 0.20$:	0.92	0.85
Degree of IRS, γ		
1/8	0.86	0.74
1/4	0.81	0.64
1/2	0.70	0.48
1	0.52	0.22

Intuition: Double the “keep rate” $1 - \tau$.

- What is the long-run effect on GDP?
 - Answer: $2^{\eta_Y, 1-\tau} = 2^{\gamma\zeta}$
 - Baseline: $\gamma = 1/2$ and $\zeta = 1/6 \Rightarrow 2^{1/12} \approx 1.06$

Going from $\tau = 75\%$ to $\tau = 50\%$ raises GDP by just 6%!

- With $\Delta\rho = 10\%$, the revenue cost is 2.5% of GDP
 - 6% gain to everyone...
 - > redistributing 2.5% to the bottom half!
- 6% seems small, but achieved by a small group of researchers working 15% harder...

Maximizing Worker Welfare

- In Saez (2001), revenue max = max worker welfare
- Not here! Ignores effect on **consumption**
- Worker welfare yields a clean closed-form solution

Choose τ and τ_0 to Maximize Worker Welfare

- Workers: $c^w = w(1 - \tau_0)$
 $u_w(c) = \theta \log c$

- Government budget constraint

$$\tau_0 Y + (\tau - \tau_0)[\rho Y - \bar{w}(S_a + M)] = \Omega Y$$

Exogenous government spending share of GDP = Ω
(to pay for basic research, legal system, etc.)

- Problem: $\max_{\tau, \tau_0} \log(1 - \tau_0) + \log Y(\tau)$ s.t.
 $\tau_0 Y + (\tau - \tau_0)[\rho Y - \bar{w}(S_a + M)] = \Omega Y.$

First Order Conditions

- The top rate that maximizes worker welfare satisfies

$$\tau_{ww}^* = \frac{1 - \eta_{Y,1-\tau} \left(\frac{1-\rho}{\Delta\rho} \cdot \tau_0^* + \frac{1-\Delta\rho}{\Delta\rho} \cdot (1 - \tau_0^*) - \frac{\Omega}{\Delta\rho} \right)}{1 + \frac{\rho}{\Delta\rho} \eta_{Y,1-\tau}}.$$

- Three new terms relative to Saez:

$$\eta \frac{1-\rho}{\Delta\rho} \cdot \tau_0^*$$

Original term from RevMax

$$\eta \frac{1-\Delta\rho}{\Delta\rho} \cdot (1 - \tau_0^*)$$

Direct effect of a higher tax rate reducing GDP
 \Rightarrow reduce workers consumption

$$\eta \frac{\Omega}{\Delta\rho}$$

Need to raise Ω in revenue

Intuition

- When is a “flat tax” optimal?

$$\tau \leq \tau_0 \iff \eta_{Y,1-\tau} \geq \frac{\Delta\rho}{1-\Delta\rho}.$$

Two ways to increase c^w :

- $\downarrow \tau \Rightarrow$ raises GDP by $\eta_{Y,1-\tau}$
- Redistribute \Rightarrow take from $\Delta\rho$ people, give to $1 - \Delta\rho$
- Baseline parameters: $\eta_{Y,1-\tau} = \frac{1}{6}(\gamma + \psi)$ and $\frac{\Delta\rho}{1-\Delta\rho} = \frac{1}{9}$.

$$\gamma + \psi > 2/3 \Rightarrow \tau < \tau_0.$$

Tax Rates that Maximize Worker Welfare

Degree of IRS, γ	Behavioral elast. = 0.2		Behavioral elast. = 0.5	
	τ_{ww}^*	τ_0^*	τ_{ww}^*	τ_0^*
1/8	0.64	0.15	0.32	0.19
1/4	0.49	0.17	0.07	0.21
1/2	0.22	0.20	-0.37	0.26
1	-0.25	0.25	-1.03	0.34

The top rate that maximizes worker welfare can be negative!

Maximizing Utilitarian Social Welfare

Entrepreneurs and Managers

- Utility function depends on consumption and effort:

$$u(c, e) = \theta \log c - \zeta e^{1/\zeta}$$

- Researcher with talent z solves

$$\max_{c, e} u(c, e) \quad \text{s.t.}$$

$$c = \bar{w}(1 - \tau_0) + [w_s e z - \bar{w}](1 - \tau) + R$$

$$= \bar{w}(1 - \tau_0) - \bar{w}(1 - \tau) + w_s e z(1 - \tau) + R$$

$$= \bar{w}(\tau - \tau_0) + w_s e z(1 - \tau) + R$$

where R is a lump sum rebate.

- FOC:

$$e^{\frac{1}{\zeta} - 1} = \frac{\theta w_s z (1 - \tau)}{c}.$$

SE/IE and Rebates

- Log preferences imply that SE and IE cancel: $\frac{\partial e}{\partial \tau} = 0$
- Standard approach is to rebate tax revenue to neutralize the IE.
 - Tricky here because IE's are heterogeneous!
- Shortcut: heterogeneous rebates that vary with z to deliver

$$c_z = w_s e z (1 - \tau)^{1-\alpha}$$

$$e_z = e^* = [\theta(1 - \tau)^\alpha]^\zeta,$$

where α parameterizes the elasticity of effort wrt $1 - \tau$

- $\eta_{Y,1-\tau} = \alpha\zeta(\gamma + \psi)$
- governs tradeoff with redistribution

Utilitarian Social Welfare

- Social Welfare:

$$SWF \equiv Lu(c^w) + S_b u(c^b) + S_a \int u(c_z^s, e_z^s) dF(z) + M \int u(c_z^m, e_z^m) dF(z)$$

- Substitution of equilibrium conditions gives

$$SWF \propto \log Y + \ell \log(1 - \tau_0) + s[(1 - \alpha) \log(1 - \tau) - \zeta(1 - \tau)^\alpha]$$

where $s \equiv \frac{S_a + M}{L + S_b + S_a + M}$, $\ell \equiv 1 - s$,

Tax Rates that Maximize Social Welfare

- Proposition 2 gives the tax rates, written in terms of the “keep rates” $\kappa \equiv 1 - \tau$ and $\kappa_0 \equiv 1 - \tau_0$.
- Two well-behaved nonlinear equations:

$$\alpha \zeta s \kappa^\alpha + \frac{\kappa}{\kappa_0} \cdot \frac{\ell}{1 - \Delta \rho} (\Delta \rho + \bar{\rho} \eta) = \eta \left(1 + \frac{\bar{\rho} \ell}{1 - \Delta \rho} \right) + s(1 - \alpha)$$

$$\kappa_0(1 - \Delta \rho) + \kappa \Delta \rho = 1 - \Omega.$$

Maximizing Social Welfare: $\alpha = 1$

Tax Rates that Maximize Social Welfare ($\alpha = 1$)

Degree of IRS, γ	Behavioral elast. = 0.2		Behavioral elast. = 0.5	
	τ^*	GDP loss if $\tau = 0.75$	τ^*	GDP loss if $\tau = 0.75$
1/8	0.65	0.7%	0.40	3.6%
1/4	0.50	2.8%	0.16	9.6%
1/2	0.23	8.9%	-0.26	23.6%
1	-0.24	23.4%	-0.92	49.3%

Tax Rates that Maximize Social Welfare ($\alpha = 1/2$)

Degree of IRS, γ	Behavioral elast. = 0.2		Behavioral elast. = 0.5	
	τ^*	GDP loss if $\tau = 0.75$	τ^*	GDP loss if $\tau = 0.75$
1/8	0.45	0.8%	0.33	2.0%
1/4	0.37	1.9%	0.19	4.8%
1/2	0.22	4.6%	-0.07	11.4%
1	-0.05	11.3%	-0.52	26.0%

Intuition: First-Best Effort

- What if social planner could choose consumption and effort?
- The tax rate that implements first-best effort satisfies

$$(1 - \tau)^\alpha = \frac{\gamma}{s_a}$$

⇒ **Negative** top tax rate if $s_a < \gamma$.

- Illustrates a key point:

the fact that a **small share of people, s**
create **nonrival ideas that drive growth via γ**
constrains the **top tax rate, τ**

Summary of Calibration Exercises

Exercise

Top rate, τ

No ideas, $\gamma = 0$

Revenue-maximization, $\tau_0 = 0$ 0.96

Revenue-maximization, $\tau_0 = 0.20$ 0.92

With ideas

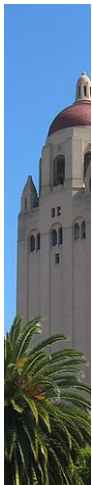

$\gamma = 1/2$ $\gamma = 1$

Revenue-maximization 0.70 0.52

Maximize worker welfare 0.22 -0.25

Maximize utilitarian welfare 0.22 -0.05

Incorporating ideas sharply lowers the top tax rate.

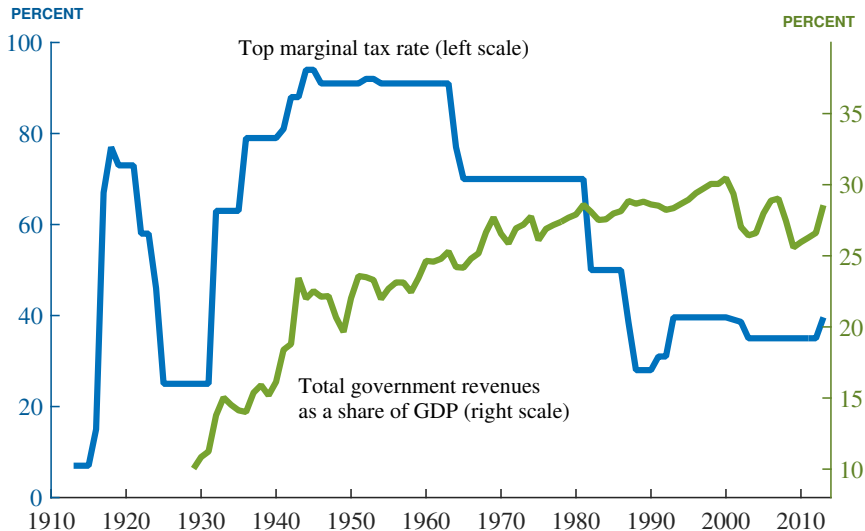

Discussion

Evidence on Growth and Taxes? Important and puzzling!!!

- Stokey and Rebelo (1995)
 - Growth rates flat in the 20th century
 - Taxes changed a lot!
- But the counterfactual is unclear
 - Government investments in basic research after WWII
 - Decline in basic research investment in recent decades?
 - Maybe growth would have slowed sooner w/o $\downarrow \tau$
- Short-run vs long-run?
 - Shift from goods to ideas may **reduce** GDP in short run...

Taxes in the United States

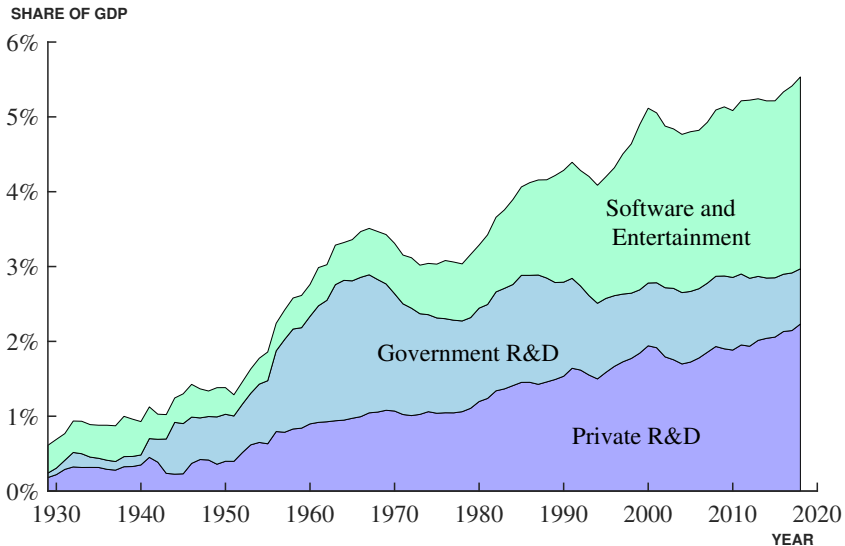

U.S. GDP per person

PER CAPITA GDP (RATIO SCALE, 2017 DOLLARS)

U.S. R&D Spending Share

The Social Return to Research

- How big is the gap between equilibrium share and optimal share to pay for research?
- Jones and Williams (1998) social rate of return calculation here:

$$\tilde{r} = g_Y + \lambda g_y \left(\frac{1}{\rho_s(1-\tau)} - \frac{1}{\gamma} \right)$$

⇒ After tax share of payments to entrepreneurs should equal γ

- Simple calibration: $\tau = 1/2 \Rightarrow \tilde{r} = 39\%$ if $\rho_s = 10\%$
 - Consistent with SROR estimates e.g. Bloom et al. (2013)
 - But those are returns to formal R&D...

Environment for Full Growth Model

Final output	$Y_t = \int_0^{A_t} x_{it}^{1-\psi} di (\mathbb{E}(ez)M_t)^\psi$
Production of variety i	$x_{it} = \ell_{it}$
Resource constraint (ℓ)	$\int \ell_{it} di = L_t$
Resource constraint (N)	$L_t + S_{bt} = N_t$
Population growth	$N_t = \bar{N} \exp(nt)$
Entrepreneurs	$S_{at} = \bar{S}_a \exp(nt)$
Managers	$M_t = \bar{M} \exp(nt)$
Applied ideas	$\dot{A}_t = \bar{a}(\mathbb{E}(ez)S_{at})^\lambda A_t^{\phi_a} B_t^\alpha$
Basic ideas	$\dot{B}_t = \bar{b}S_{bt}^\lambda B_t^{\phi_b}$
Talent heterogeneity	$z_i \sim F(z)$
Utility (S_a, M)	$u(c, e) = \theta \log c - \zeta e^{1/\zeta}$

Conclusion

- Lots of unanswered questions
 - Why is evidence on growth and taxes so murky?
 - What is true effect of taxes on growth and innovation?
Akcigit et al (2018) makes progress...
 - At what income does the top rate apply?
 - Capital gains as compensation for innovation
 - Transition dynamics
- Still, **innovation** is a key force that needs to be incorporated
 - Distorting the behavior of a small group of innovators can affect **all our incomes**
